Text book:

- Operating System Concepts – Abraham Siblerschatz
- Modern Operating System – Andrew Tanenbaum

Group Projects

Chapter 1 Operating System Overview

- ① Notion of operating system
- ② History of operating Systems
- ③ Definition and Classifications
- ④ Basic Properties of Operating Systems
- ⑤ Notions in operating systems
- ⑥ Operating System structures
- ⑦ Principles of Operating Systems

Chapter 1 Operating System Overview

- ① Operating system notion
- ② History of Operating Systems
- ③ Definition and Classifications
- ④ Basic Properties of Operating Systems
- ⑤ Notions in operating systems
- ⑥ Operating System structures
- ⑦ Principles of Operating Systems

Chapter 1. Operating System Overview

1. Notion of operating system

① Notion of operating system

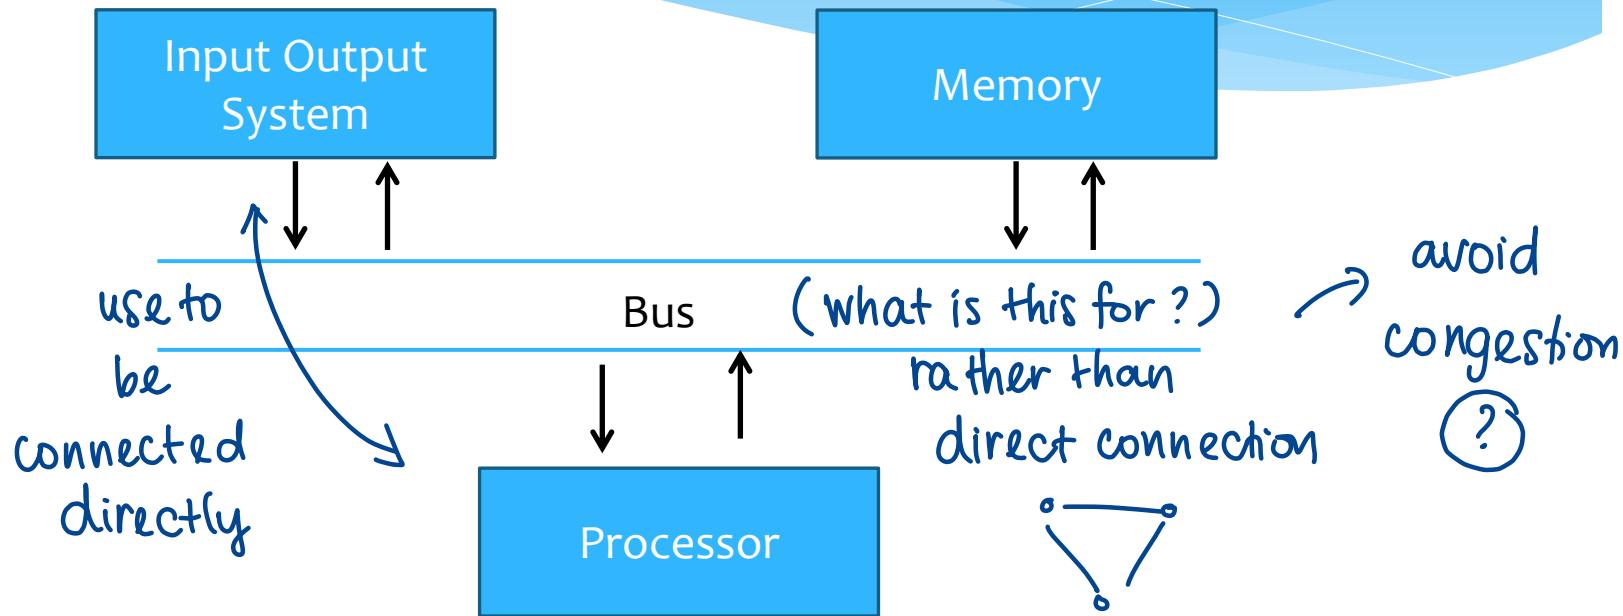

- Layered structure of a computing system
- Operating system's functions

Chapter 1. Operating System Overview

1. Notion of operating system

1.1. Layered structure of a computing system

A computer system's structure

- One/ many CPUs, controlling devices are linked by a common bus system to access a shared memory.
- Controlling devices and CPU operate simultaneously and compete with each other.

Chapter 1. Operating System Overview

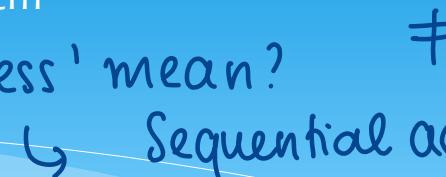

1. Notion of operating system

1.1. Layered structure of a computing system

RAM: What does 'Random Access' mean?

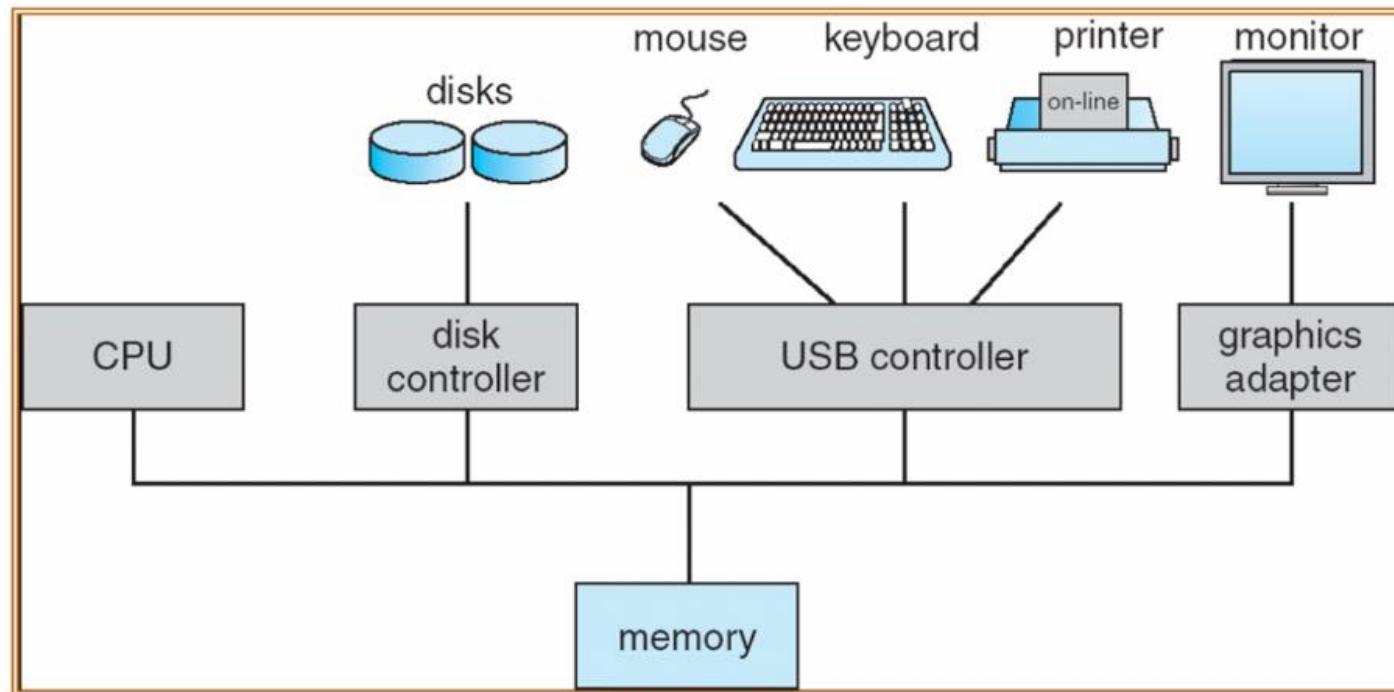

Random access : directly to index

Sequential access : traverse from 0 → dest

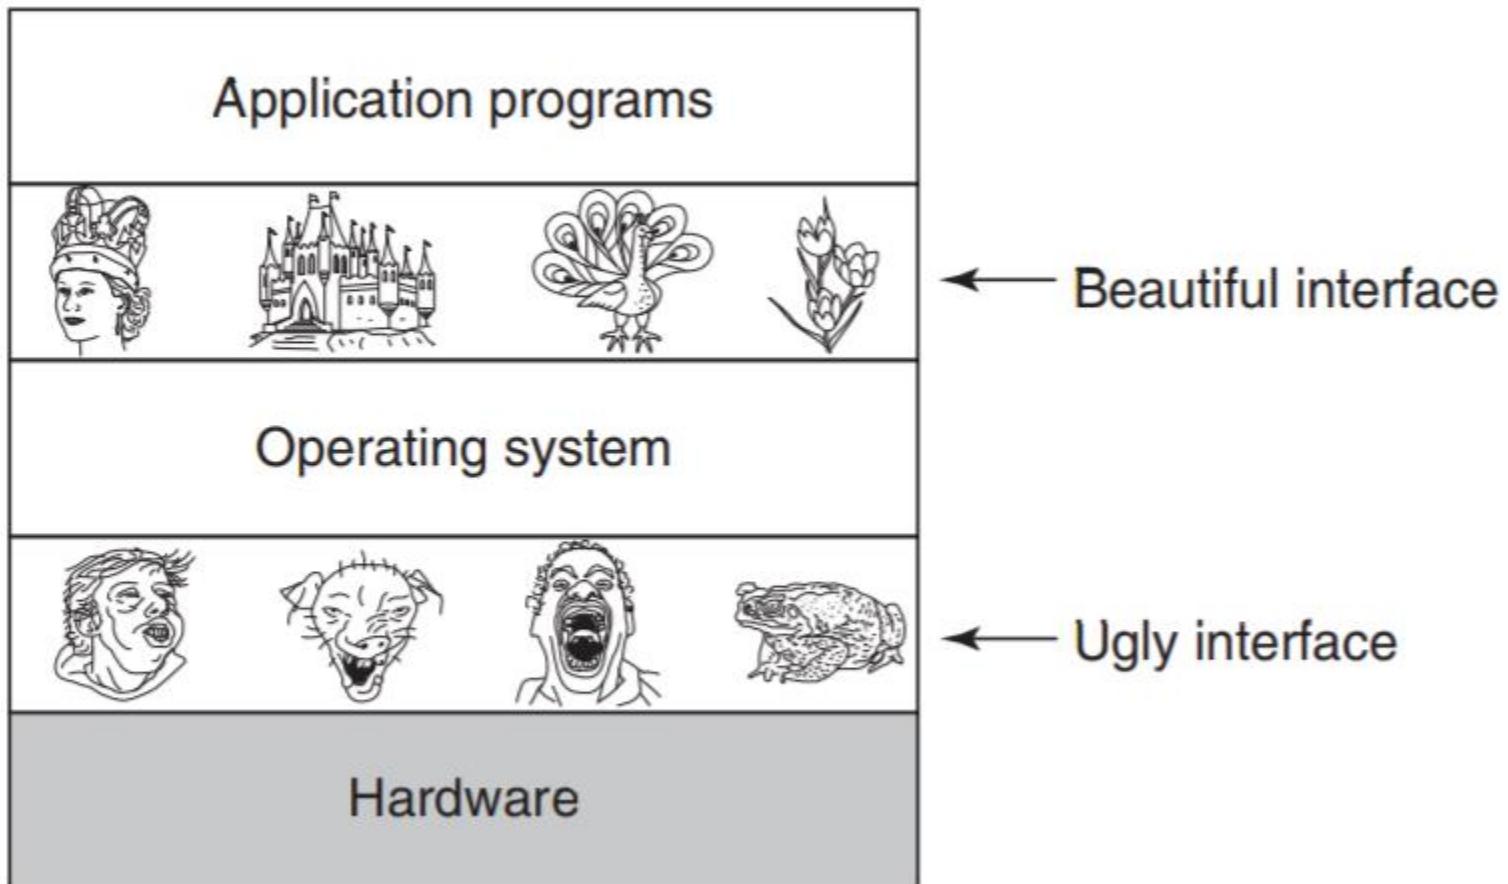

● A computer system's structure

Chapter 1. Operating System Overview

1. Notion of operating system

1.1. Layered structure of a computing system

Operating systems turn ugly hardware into beautiful abstractions

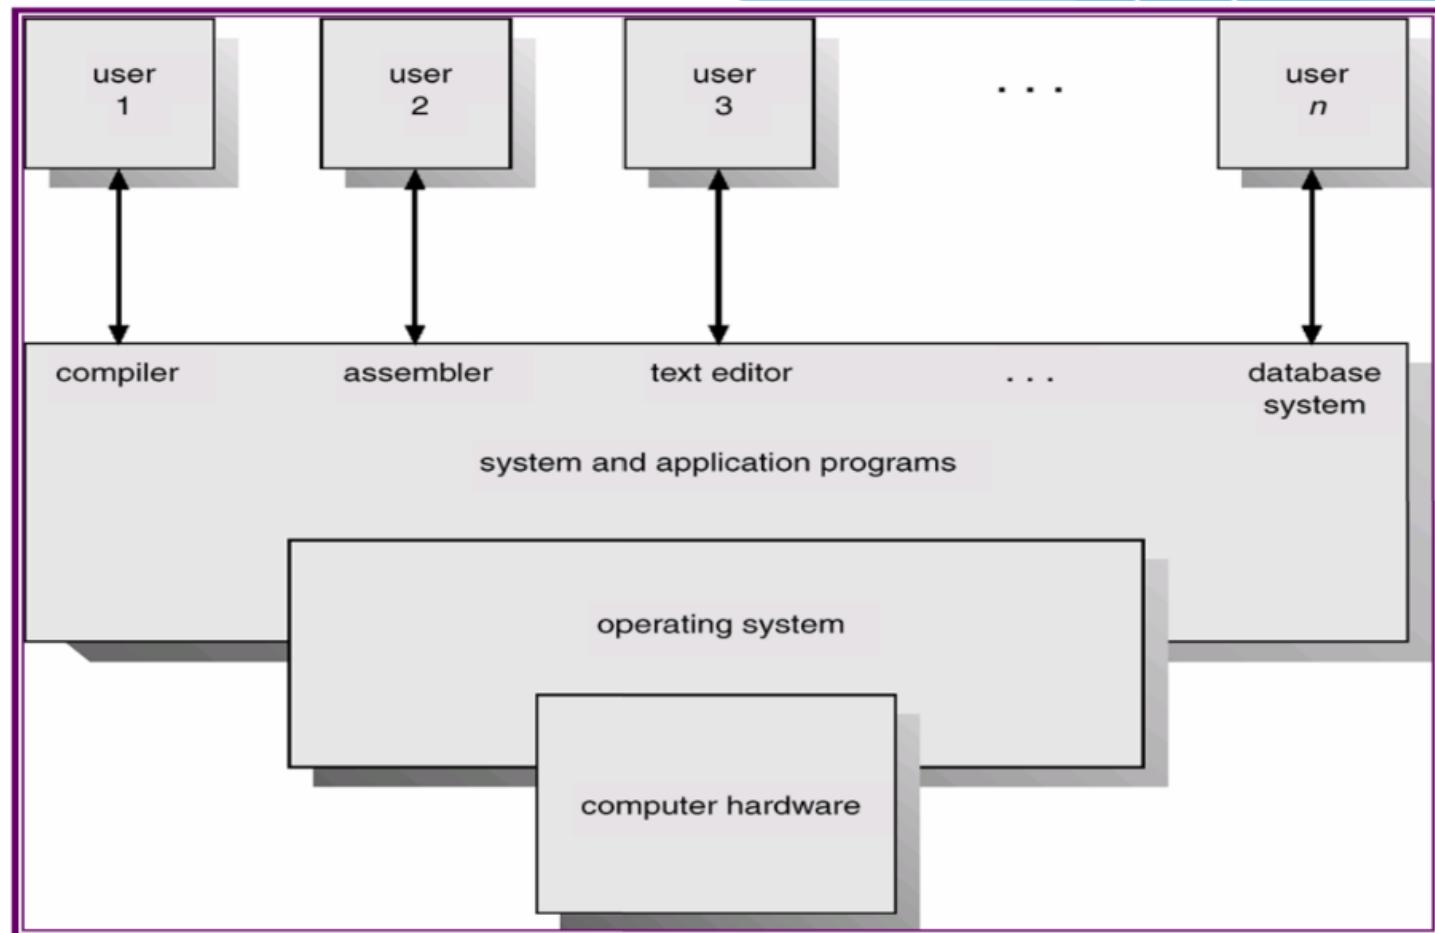

Chapter 1. Operating System Overview

1. Notion of operating system

1.1. Layered structure of a computing system

(The architecture of a computing system?)

● A computer system's components (Silberschatz 2002)

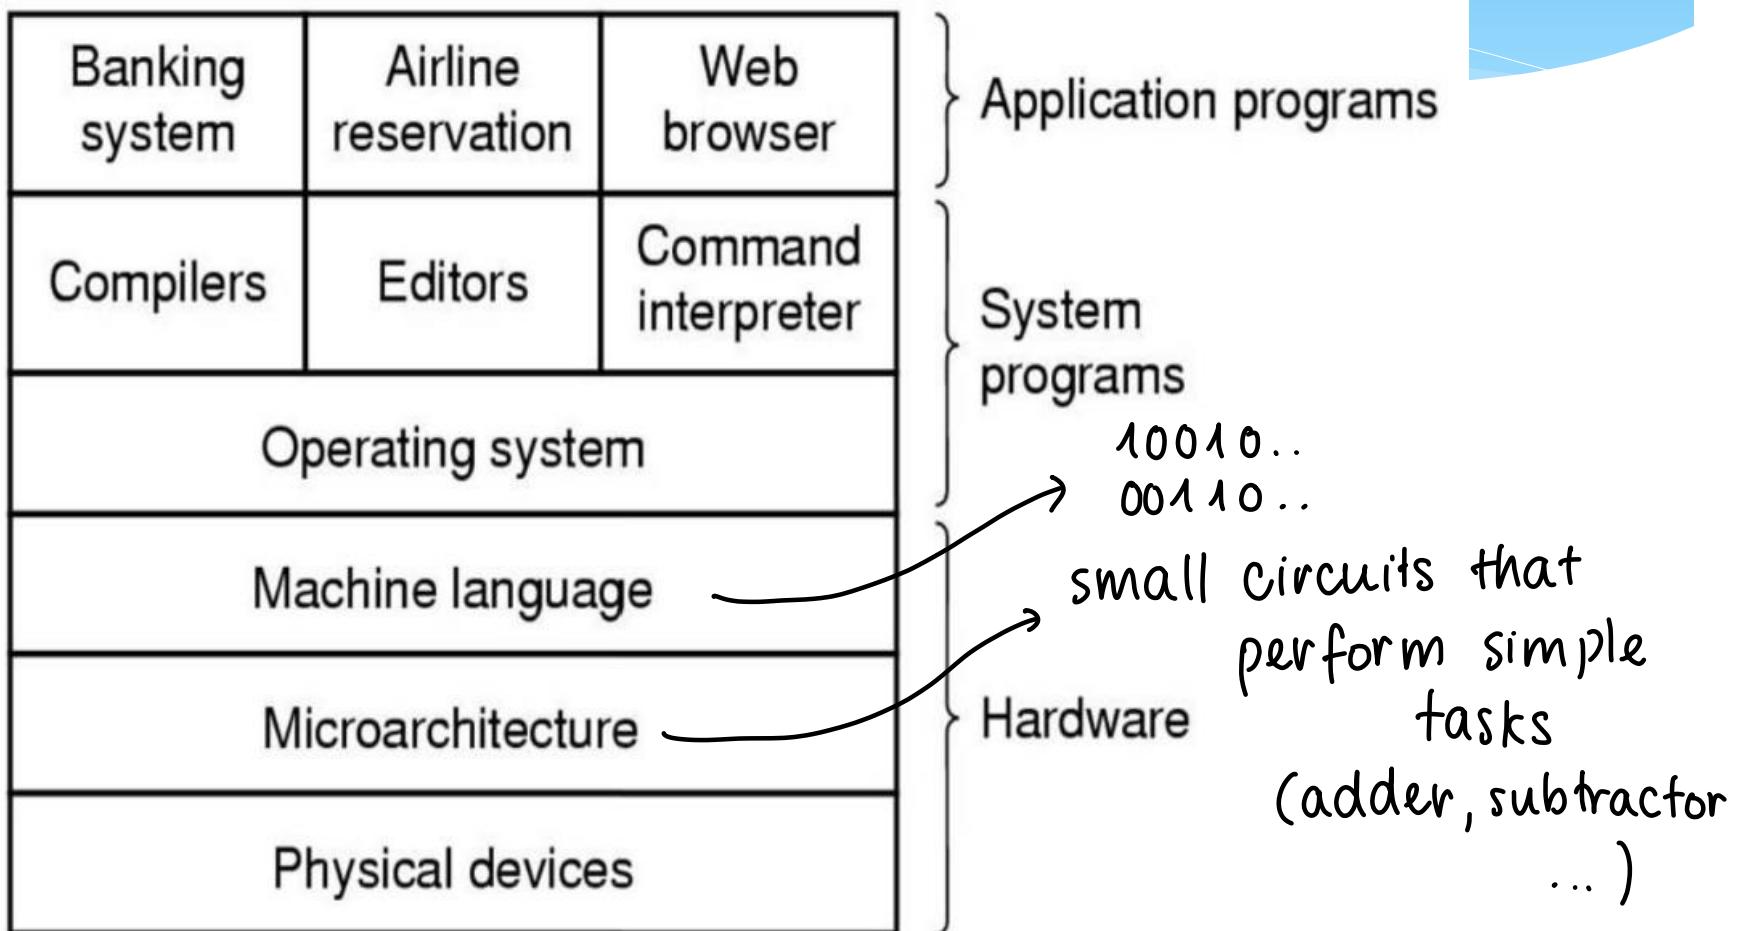

Chapter 1. Operating System Overview

1. Notion of operating system

1.1. Layered structure of a computing system

● A computer system's components (**Tanenbaum 2001**)

Chapter 1. Operating System Overview

1. Notion of operating system

1.1. Layered structure of a computing system

- A computing system's components
- **Hardware:** Provides basic computing resources (CPU, memory, input-output devices)
- **Operating system:** controls and cooperates hardware using works for application programs of different users.
- **Application programs:** (compiler, database system, game...) utilizes computer's resource to handle users' requests.
- **Users:** People who work/operate the machines or computers (end-users, dev, operators ...)

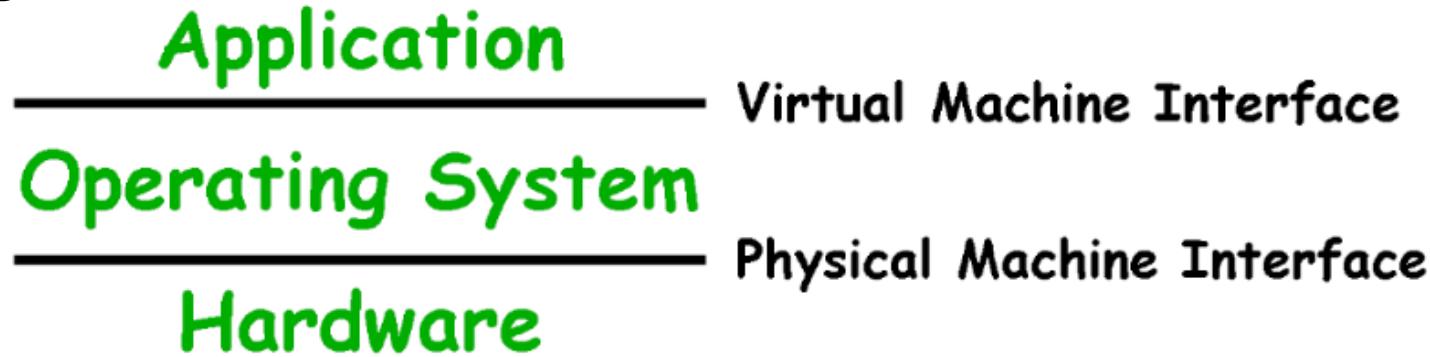

Chapter 1. Operating System Overview

1. Notion of operating system

1.1. Layered structure of a computing system

Objectives

- Operating system lies between the system's hardware and application program

- Objectives: To provide an environment which helps user run application program and use the computer system easier, more conveniently and effectively.

- Standardize the user interface for different hardware systems
- Utilize hardware resource effectively and exploit the hardware performance optimally.

UI looks the same as long as
it is the same OS

Chapter 1. Operating System Overview

1. Notion of operating system

① Notion of operating system

- Layered structure of a computing system
- Operating system's functions

Chapter 1. Operating System Overview

1. Notion of operating system

1.2. Operating system's functions

① Simulate a virtual computer machine

② Manage system resources

Chapter 1. Operating System Overview

1. Notion of operating system

1.2. Operating system's functions

Simulate a virtual computer machine

Help hide detailed works and exploit computer hardware's functions easier and more effectively.

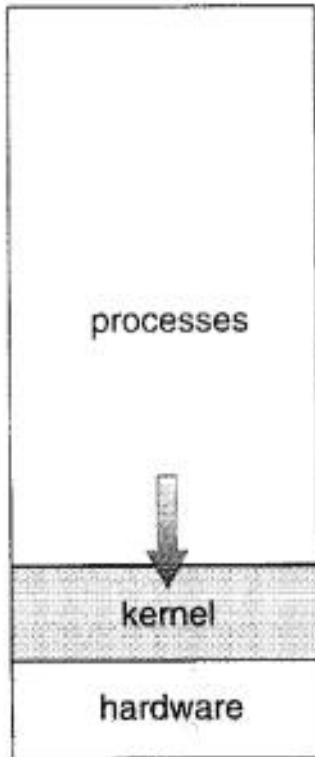

- Simplify programming problem
 - No need to work with binary sequences
 - Each program thinks that it own the whole computer's memory, CPU time, devices...
 - Help communicating with devices easier than with original device. Ex: Ethernet card: Reliable communication, ordered (TCP/IP)
- Extend the system's abilities: The system seem to have desired resources (virtual memory, virtual printer...)
- Help programs not violating each other → a program which does not work would not damage the whole system
- Useful for operating system's development
 - If the experimental operating system get errors, only limited in the virtual machine
 - Help verifying other programs in the operating system

Chapter 1. Operating System Overview

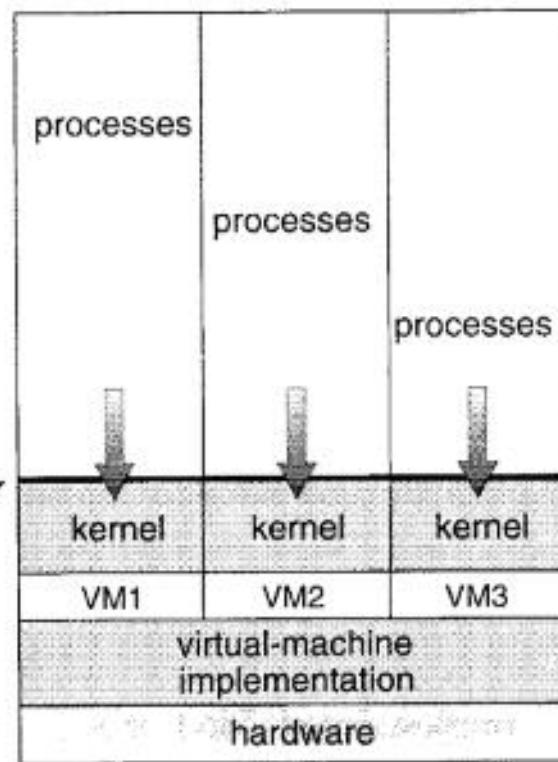

1. Notion of operating system

1.2. Operating system's functions

Simulate a virtual computer machine

Non virtual machine

With virtual machine

Chapter 1. Operating System Overview

1. Notion of operating system
- 1.2. Operating system's functions

System's resources management

- System's resources (CPU, memory, IO devices, files...) are utilized by program to perform a determined task.
- Programs require resources: time (CPU-usage) and space (memory)
- The operating system has to manage the resource so that the computer can work in the most effective way.
 - Provide resource for program when it's necessary.
 - Competition handling
 - Decide the order of resource providing for the programs' requirements
 - Example: memory resource management (limited)
 - Many program can operate at the same time.
 - Avoid illegal access
 - Data protection (memory sharing: file)

Chapter 1 Operating System Overview

- ① Operating system notion
- ② History of Operating Systems
- ③ Definition and Classifications
- ④ Basic Properties of Operating Systems
- ⑤ Notions in operating systems
- ⑥ Operating System structures
- ⑦ Principles of Operating Systems

Chapter 1. Operating System Overview

2. History of Operating Systems

Operating systems development's history

- History of electronic computer
- Operating systems development's history

Chapter 1. Operating System Overview

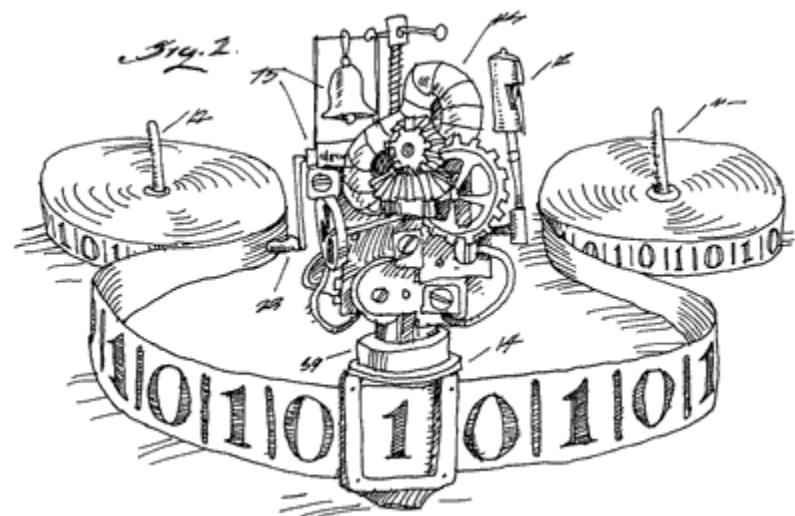

2.History of Operating Systems

2.1. History of electronic computer

Development history of electronic computers

- 1936 - A. Turing & Church present logic computing model and prove the existence of a computer: Turing machine

- Model of a character processing device;
Simple but able to perform all the
computer's algorithm
- A Turing machine that is able to
simulate any other Turing machine -> a
universal Turing machine
- *Turing* is considered as the father of
computer science and artificial intelligence

Chapter 1. Operating System Overview

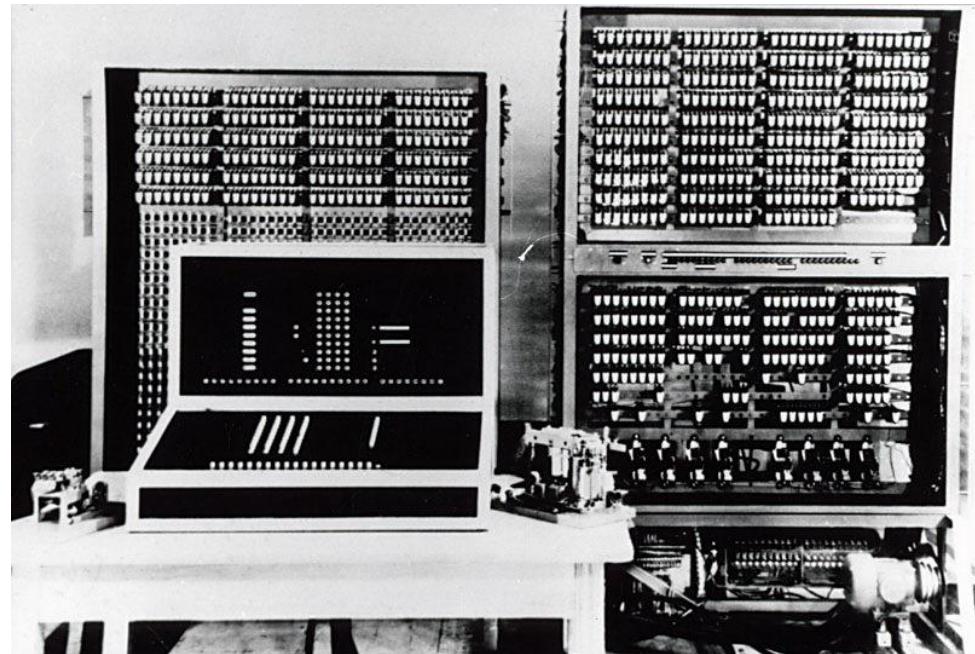

2.History of Operating Systems

2.1. History of electronic computer

Development history of electronic computers

- 1941- Konrad Zuse (German) Constructed world's first programmable computer; the functional program-controlled Turing-complete Z3

- Z3: use binary system
- Has separated memory and controller
- Mechanical technique

Chapter 1. Operating System Overview

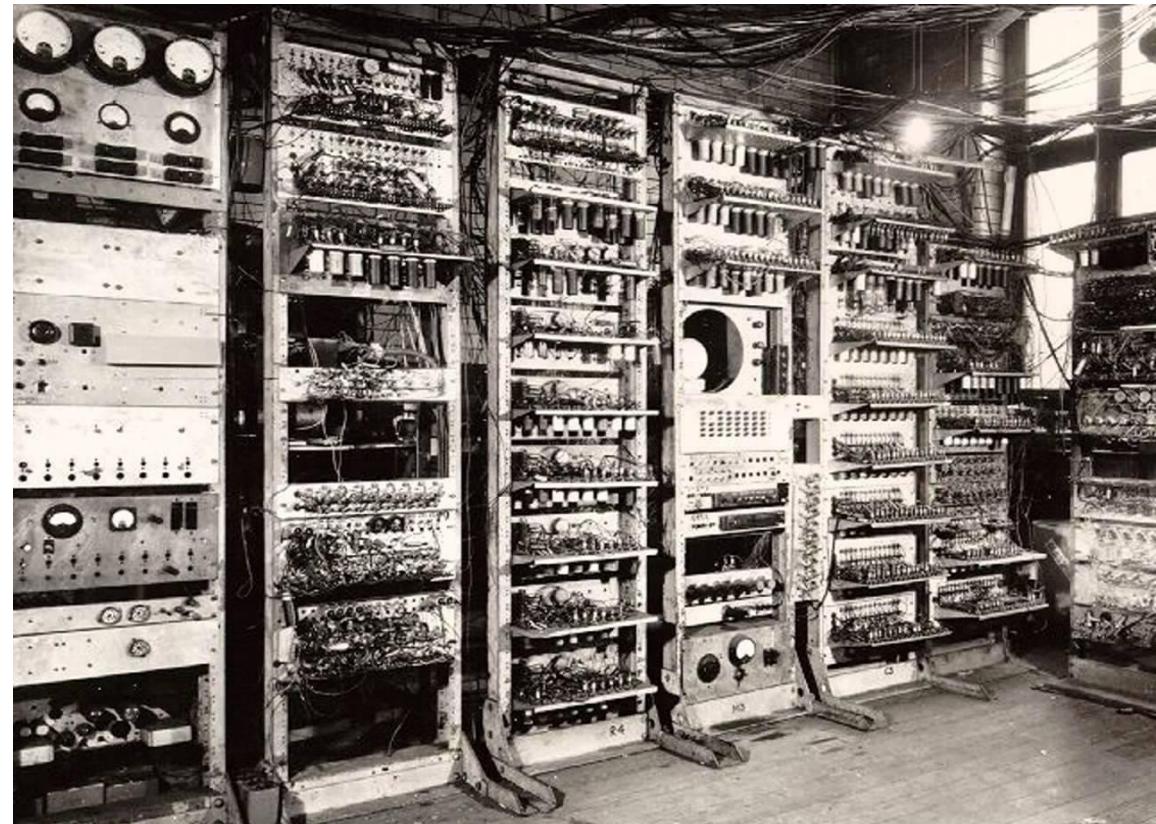

2.History of Operating Systems

2.1. History of electronic computer

Development history of electronic computers

- 1946 ENIAC based on electric bulbs

- 18000 vacuum tube
- 70000 resistance
- 5 million metal connector
- *Faster but least reliable*

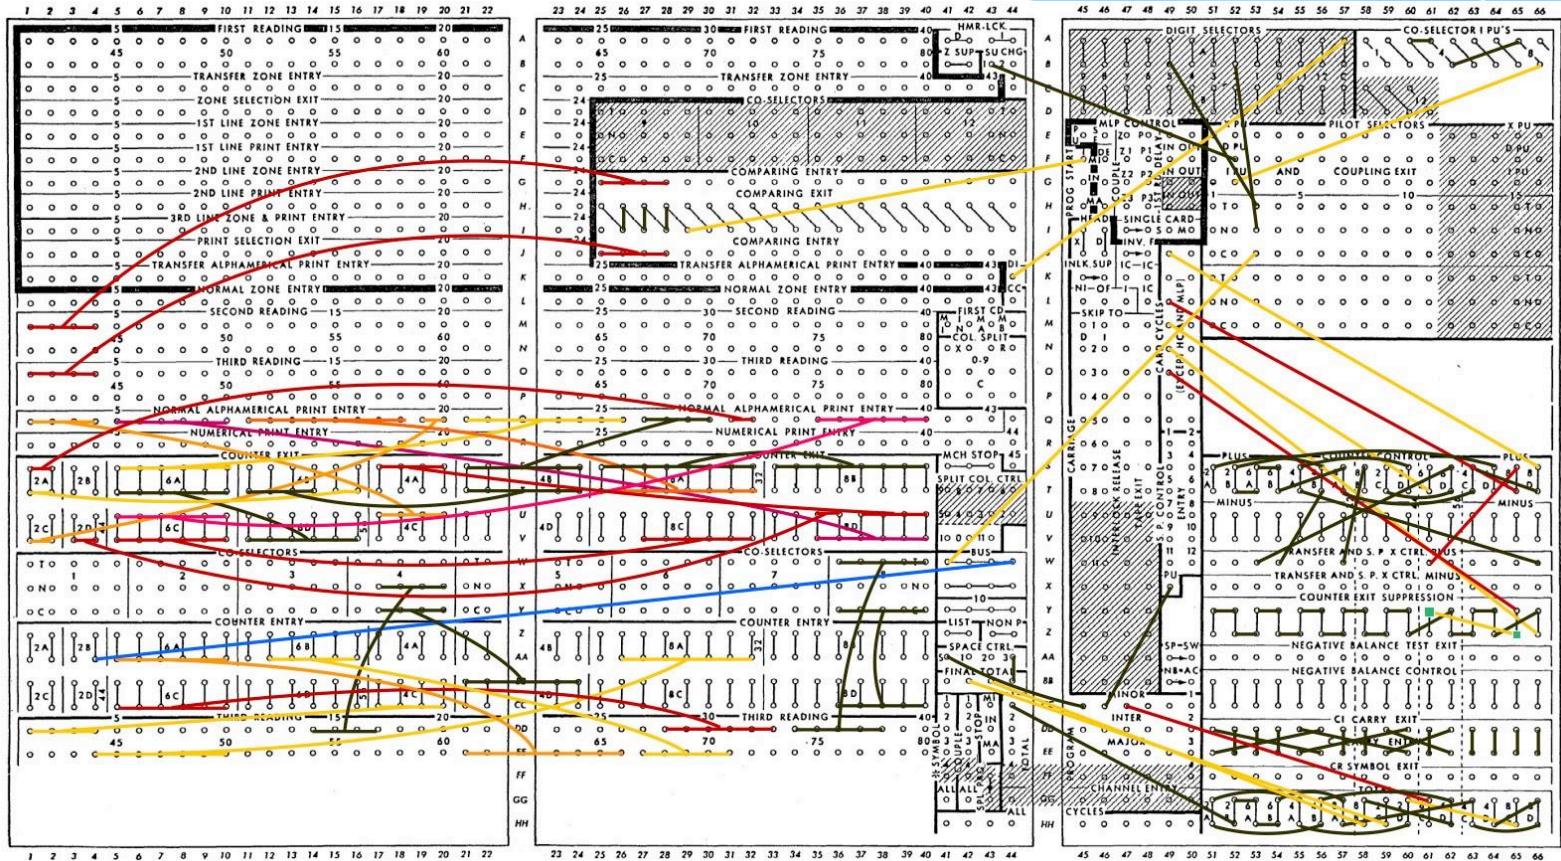

Chapter 1. Operating System Overview

2.History of Operating Systems

2.1. History of electronic computer

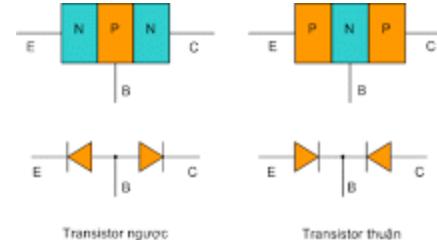

Development history of electronic computers

- plug board

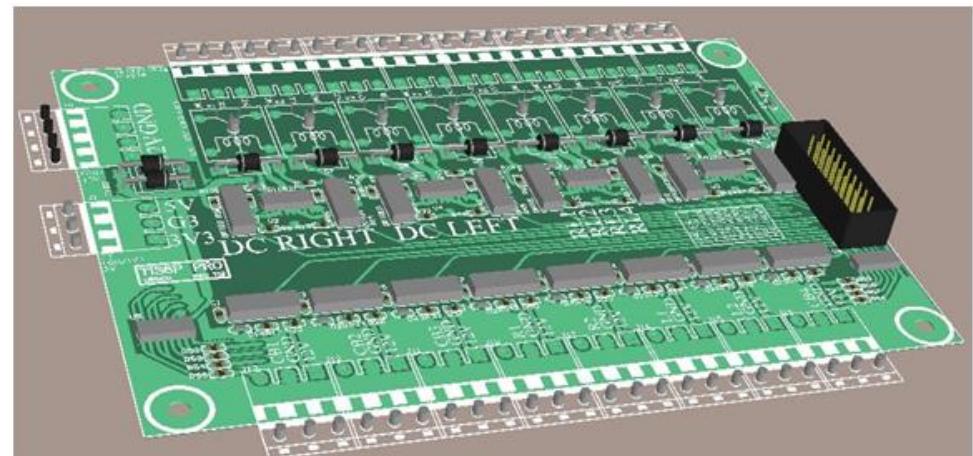

Development history of electronic computers

- 1950-1958 Transistor
- 1959-1963 Semiconductor

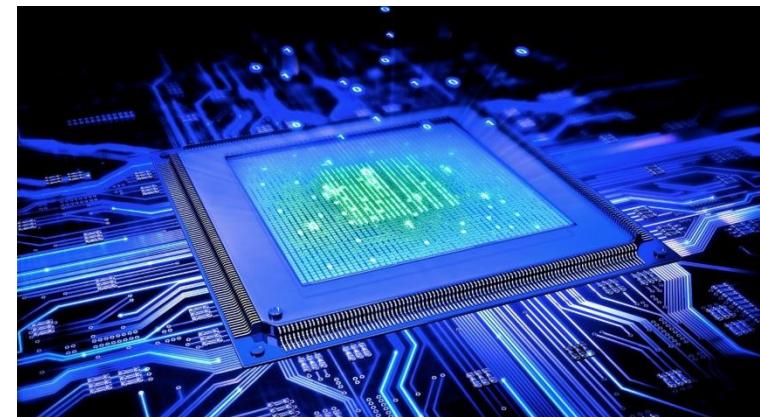

- 1964-1974 Integrated Circuit (IC)

Development history of electronic computers

- 1974-1990 Large scale IC:
Allow CPU, main memory or similar device to be produced in a single integrated circuit
-> new class of smaller, cheaper computer and parallel processor with multi CPUs
- 1990-now Very large scale IC, smart IC

Chapter 1. Operating System Overview

2. History of Operating Systems

Operating systems development's history

- History of electronic computer
- Operating systems development's history

Chapter 1. Operating System Overview
2.History of Operating Systems
 2.2. History of Operating Systems

- * 1948-1970 : Hardware expensive; human labor cheap
- * 1970-1981 : Hardware cheap; human labor expensive
- * 1981- : Hardware very cheap; human labor very expensive
- * 1981- : Distributed system
- * 1995- : Mobile devices

Chapter 1. Operating System Overview

2.History of Operating Systems

2.2. History of Operating Systems

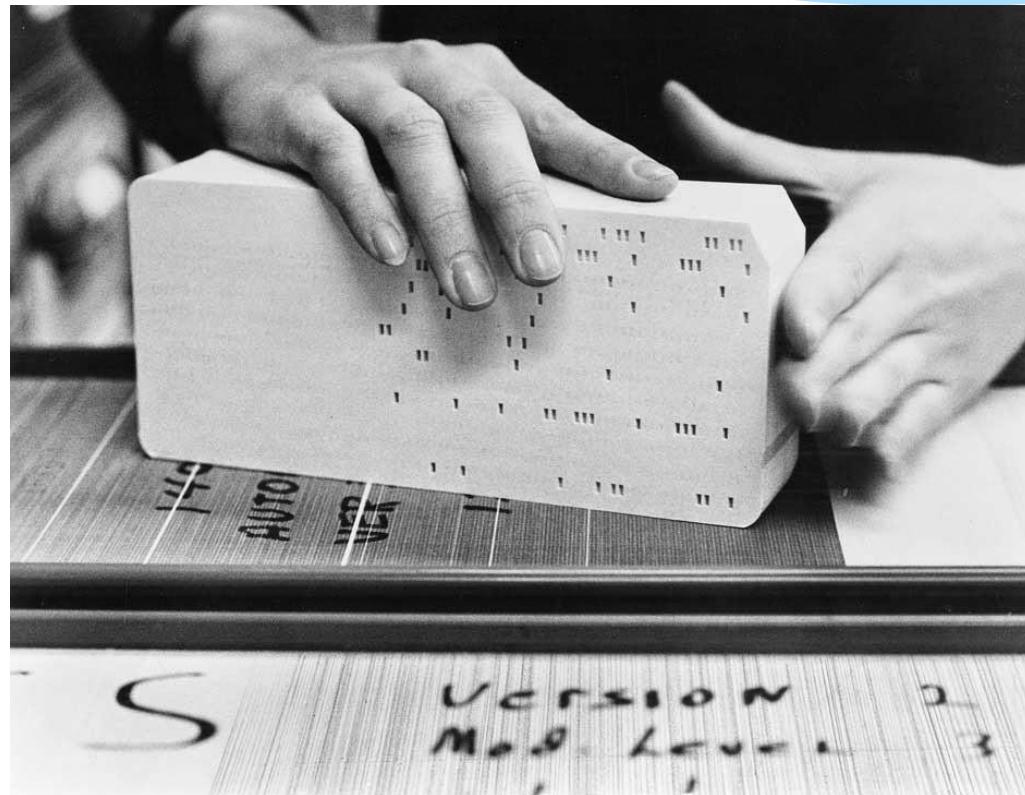

- * 1948-1970 :
 - * Computer 1-5 M\$: Nation ‘s property, mainly used for military’s purposes ⇒ Require optimization for using hardware effectively
 - * Lack of human-machine interact
 - * User, programmer; operator are same group of people
 - * One user at a single time
 - * User wrote program on punched cards
 - * First card is bootstraps loader is loaded into memory and executed
 - * Instructions in bootstraps loader fetch into memory and execute instructions on other later cards (application program)
 - * Check light bulb for results, debug
 - * Debugging is difficult
 - * Waste processor time
 - * Solution: batch processing

Chapter 1. Operating System Overview

2.History of Operating Systems

2.2. History of Operating Systems

* 1948-1970 :

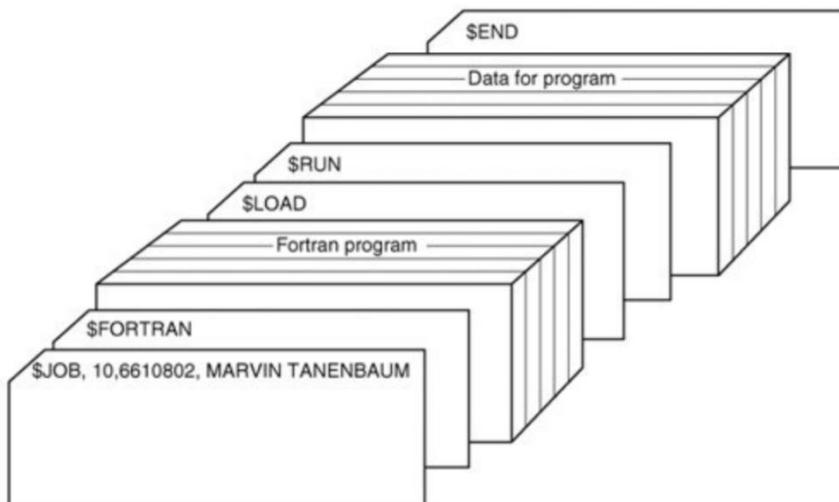

Chapter 1. Operating System Overview

2.History of Operating Systems

2.2. History of Operating Systems

- * Batch processing and professional operator
- * Programmer give program to operator
- * Operator group program into a single pack (batch)
- * Computer read and run each program consequently
- * Operator take the result, print out and give to programmer

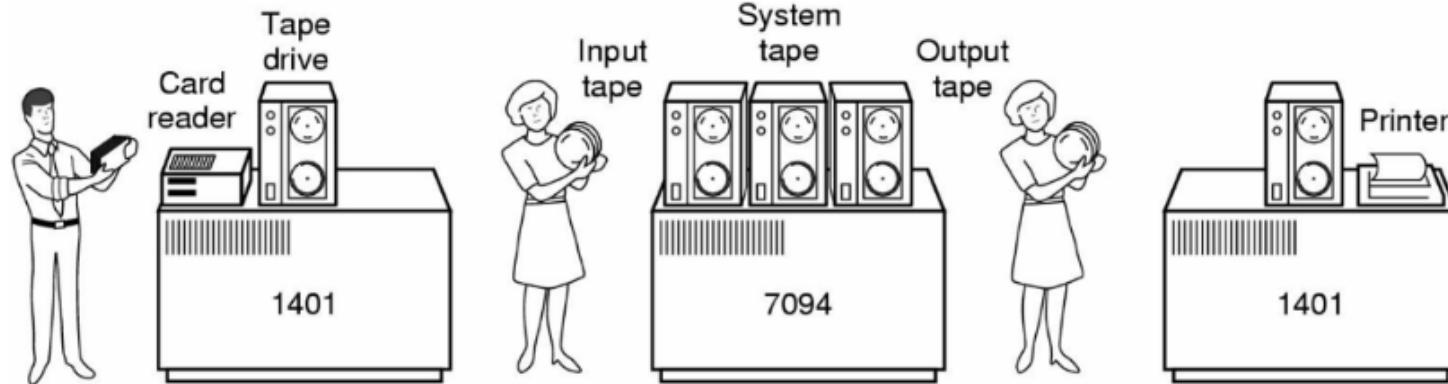

- Reduce waiting time between jobs
 - Input/output problem
 - Computer getting faster
 - Card reader still slow
- ⇒CPU has to wait for card reading/writing

Chapter 1. Operating System Overview

2.History of Operating Systems

2.2. History of Operating Systems

- * Replace card reader by tape ⇒ Independent external computers for reading/writing data
- * External devices are designed to be able to Direct Memory Access, using interrupt and i/o channel
 - * OS request I/O device then continue its work
 - * OS receive interrupt signal when I/O devices finishes
- * ⇒Allow overlap between computing and I/O

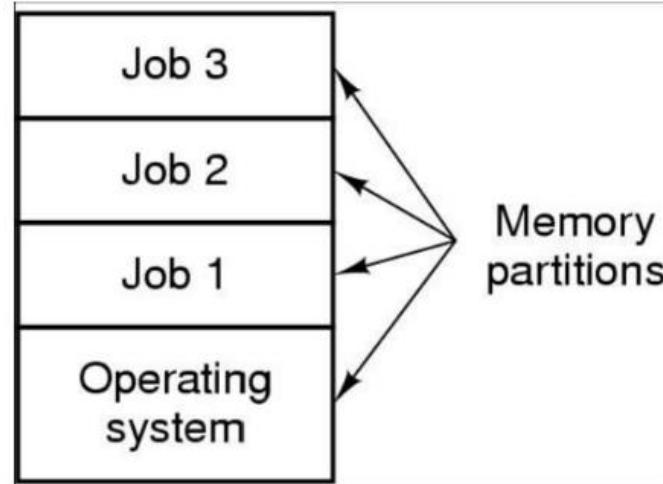

Chapter 1. Operating System Overview

2.History of Operating Systems

2.2. History of Operating Systems

- CPU is reprogrammed to be switch easily between programs
- Hard ware: memory space larger and cheaper Some program can run simultaneously -> multi programming

- More overlap between computing and I/O
- Require memory protection between programs and keep one crashed program from damaging the system
- Problem: OS has to manage all interaction ⇒ out of control (OS360: 1000 error)

Chapter 1. Operating System Overview
2.History of Operating Systems
 2.2. History of Operating Systems

* 1970-1981 :

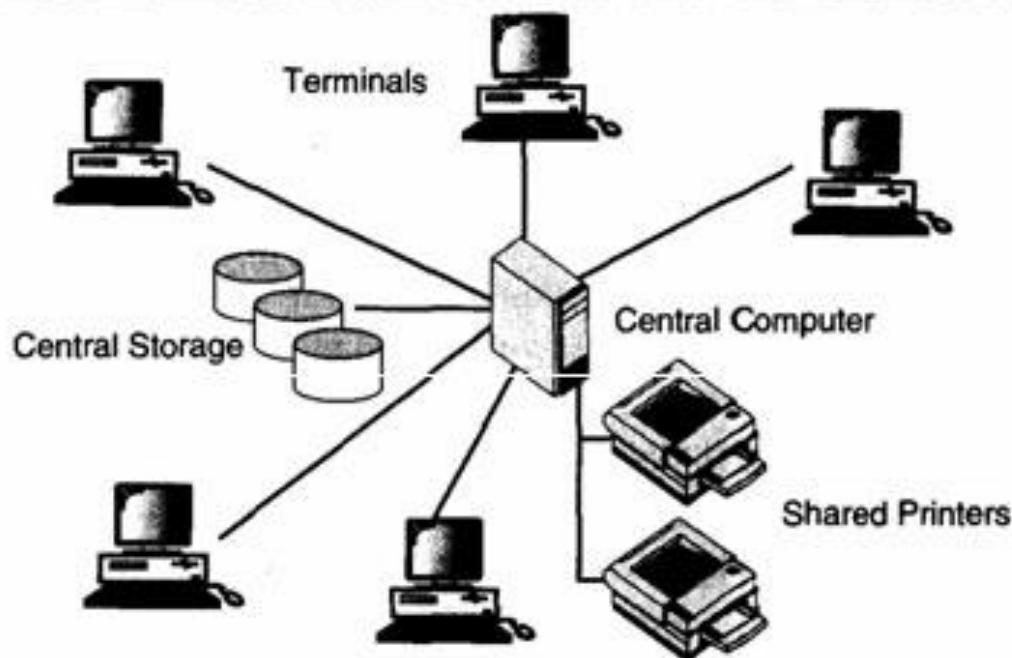

- Computers prices about 10.000\$ ⇒ used widely for different jobs
- OS technology became stable.
- Using cheap terminal device (1000\$) allow many user to interact with the system at the same time
 - User perform different works (text editor, chat, program debugging,...) ⇒ require system to be exploited effectively
 - Example: a PC: 10M calculation/s; typing speed 0.2s/1 character
 - => lost 2M calculation per one typing
 - ⇒ Time sharing operating system
 - Problem: system's response time
- Computer network was born (ARPANet : 1968) Communication between computer; Protection against network attack

Chapter 1. Operating System Overview

2.History of Operating Systems

2.2. History of Operating Systems

Time sharing system

Time-sharing Environment

Chapter 1. Operating System Overview
2.History of Operating Systems
 2.2. History of Operating Systems

- * 1981-1995 :
 - Computers prices about 1000\$; human labor 100K \$/year ⇒ Computer are used more widely for working more effectively
 - Personal computing
 - Cheap computer, single person can afford (PC).
 - OS on PC
 - Hardware resources are limited (Early : 1980s)
 - OS become library of available procedures
 - Run One program at a time (DOS)
 - PC become more powerful
 - OS meet complex problems: multi tasking, memory protection... (WINXP)
 - Graphical user interface (MAC, WIN,...)

Chapter 1. Operating System Overview

2.History of Operating Systems 2.2. History of Operating Systems

* DOS User interface

```
Welcome to FreeDOS

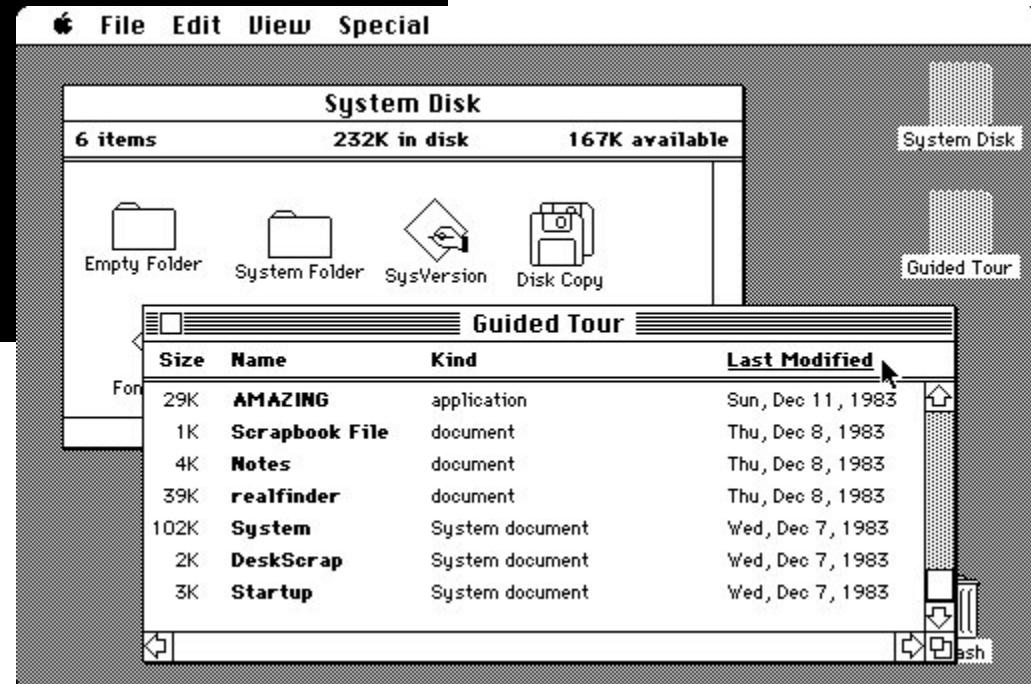

CuteMouse v1.9.1 alpha 1 [FreeDOS]
Installed at PS/2 port

C:\>_
```

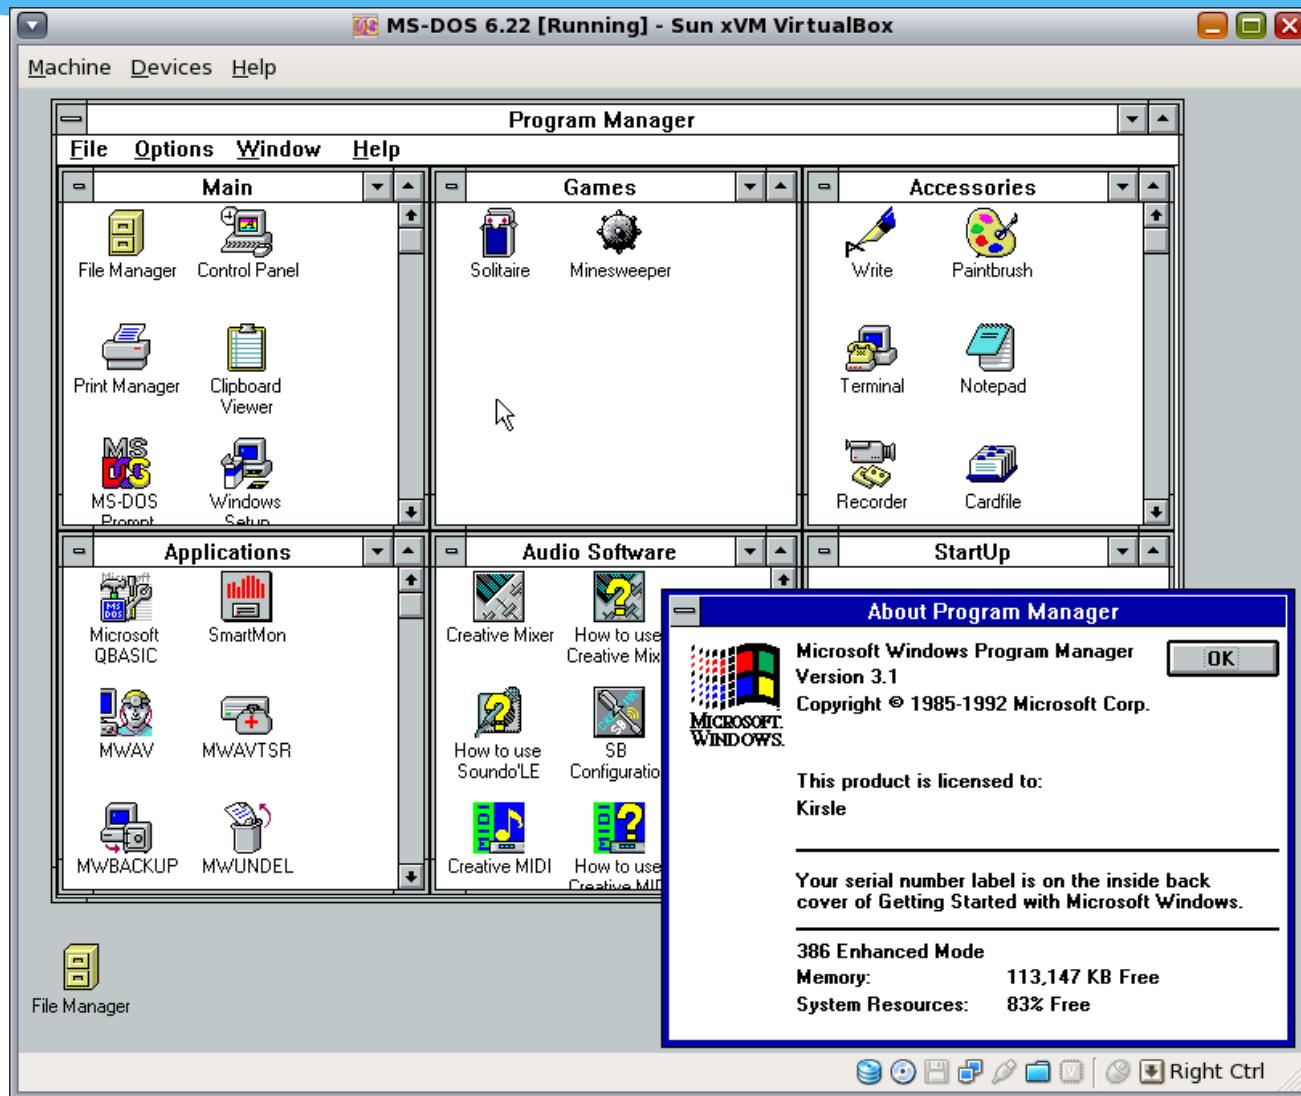

* Macintosh User interface

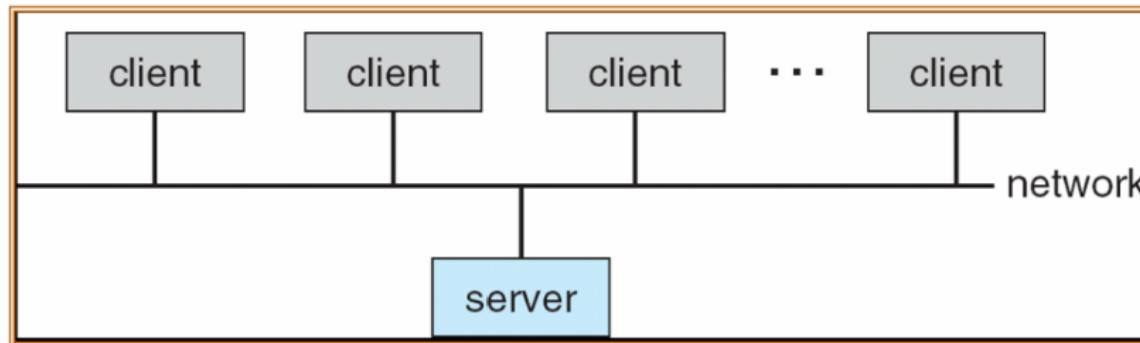

Chapter 1. Operating System Overview

2.History of Operating Systems

2.2. History of Operating Systems

- * **Distributed systems**
- Development time of networking and distributed operating systems

- Local area network
 - Computers share resources: printer, File servers,..
 - Client / Server model
- Services
 - Computing, storage
 - Services provided through Internet.
- Problems
 - Transmission delay; bandwidth, reliable...
 - Virus (love letter virus 05/2000),..

Chapter 1. Operating System Overview

2.History of Operating Systems

2.2. History of Operating Systems

- >45 millions computers were infected
- Stole information
- Auto send emails from contact list
- Download Trojan

Chapter 1. Operating System Overview
2.History of Operating Systems
 2.2. History of Operating Systems

- * Mobile devices
- * Mobile devices become more popular
 - * Phone, Laptop, PDA . . .
 - * Small, changeable and cheap → More computers/human
 - * Limited ability: speed, memory,...
- * Wide area network, wireless network
 - * Traditional computer divided into many components (wireless keyboards, mouse, remoting storage)
- * peer-to-peer system
 - * Devices with the same role working together
 - * “Operating system’s” components are spread globally
- * Cloud computing
 - * Cloud operating system

* Conclusion

- The development of the operating systems are strongly connected with the computers' development
- Operating system development pulled the development of computers

Chapter 1 Operating System Overview

- ① Operating system notion
- ② History of Operating Systems
- ③ **Definition and Classifications**
- ④ Basic Properties of Operating Systems
- ⑤ Notions in operating systems
- ⑥ Operating System structures
- ⑦ Principles of Operating Systems

Chapter 1. Operating System Overview

3. Operating System definition and classification

Operating System definition and classification

- Definitions
- Classifications

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.1. Definition of operating system

Observer's perspective

- Different objects have different requirements for operating system
- Different observing perspectives ⇒ different definitions

User: A system of programs that help exploiting the computing system conveniently

Manager: A system of programs that help managing computing system's resource effectively

Technical perspective: A system of programs equipped for a specific computer to make a new logic computer with new resource and new ability

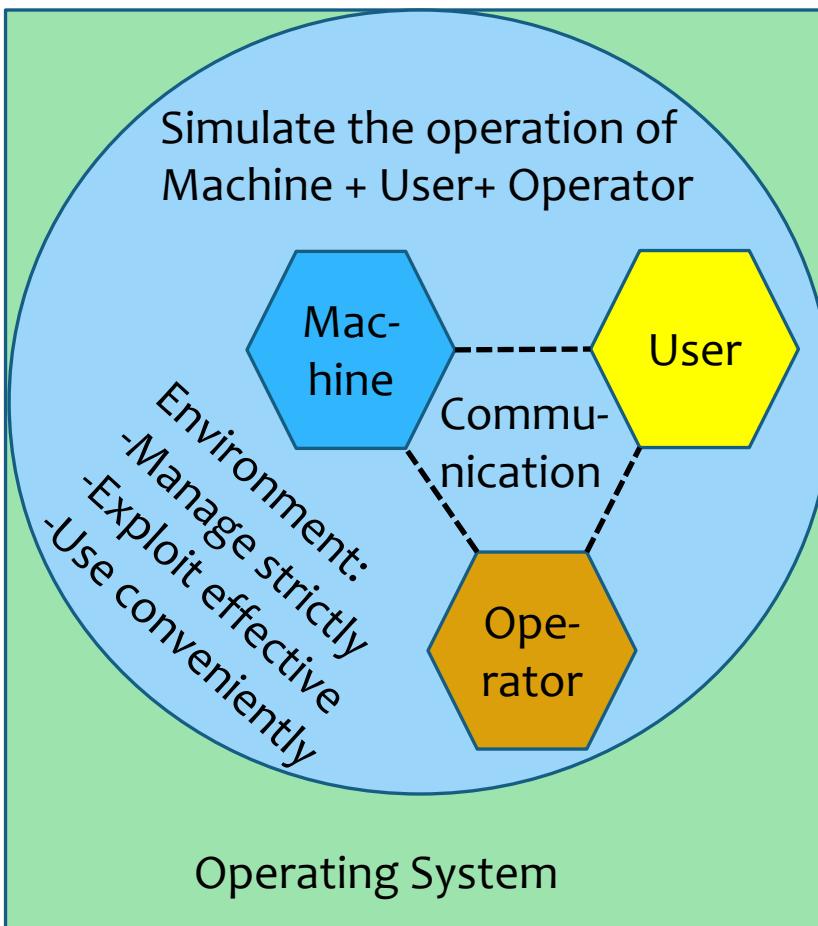

System engineer perspective: A system of programs that modelize, simulate the operation of computer, user and operators. It work in a communicating mode in order to make a convenient environment for exploiting the computer system and maximum resource management.

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.1. Definition of operating system

System engineer's perspective

Simulate 3 roles ⇒ require 3 types of languages

- Machine language
 - The only working language of the system
 - All other languages have to be translated into machine language
- System operation's language
 - OS commands (DOS: Dir, Del..; Unix: ls, rm,..)
 - Translated by the Shell
- Algorithm language
 - Programming language
 - Compiler

Chapter 1. Operating System Overview

3. Operating System definition and classification

Operating System definition and classification

- Definitions
- Classifications

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.2. Operating System Classification

- Batch processing single program system
- Batch processing multi program system
- Time sharing system
- Parallel system
- Distributed system
- Real-time processing system

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.2. Operating System Classification

Batch processing single program system

- Programs are performed consequently follow predetermined instructions
- When a program finished, the system auto run the next program without any external intervention
- Require a supervisor process the sequence of jobs and the supervisor has to stay permanent in the memory
- Need to organize a job queue
- Problem: when a program access an I/O device, processor has to wait

Batch processing multi program system

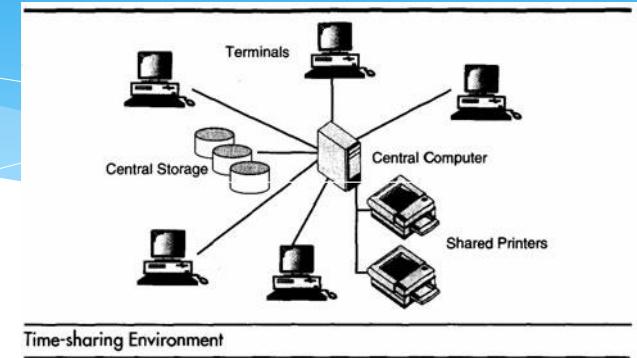

- Allow many programs to run at the same time
 - Load one part of code and data of the programs into the memory (the remaining parts will be loaded at proper moments). The programs are ready to run
 - Run the programs similar to single program system
 - If the current program performs an IO, processor will be switched to another program
- Save memory (no need to load all the programs into the memory)
- Reduce processor spare-time
- High cost for processor scheduling. Which program can use processor next?
- Solve the memory sharing problem between programs

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.2. Operating System Classification

Time sharing system

- Processor's usage allowance time is shared among ready-to-run programs
- Similar to batch processing multi program system (only load part of the programs)
- Processor is issued mainly by the operating system ⇒ how ? ⇒ Chapter 2
- Swapping times between program are small -> programs seem to run parallel
- Usually called: Multi tasking operating system (Windows)

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.2. Operating System Classification

Parallel system

- Constructed for system that has many processors
 - Many processors, works are done faster
 - More reliable: one processor breaks down will not affect the system
 - Advantage over single processor computer due to memory, peripheral devices sharing...
- Symmetric multi processing (SMP: symmetric)
 - Each processor run a single program
 - Processors communicate via a shared memory
 - Fault tolerance mechanism and optimal load balance
 - Problem: processor synchronization
 - Example: WinNT operating system

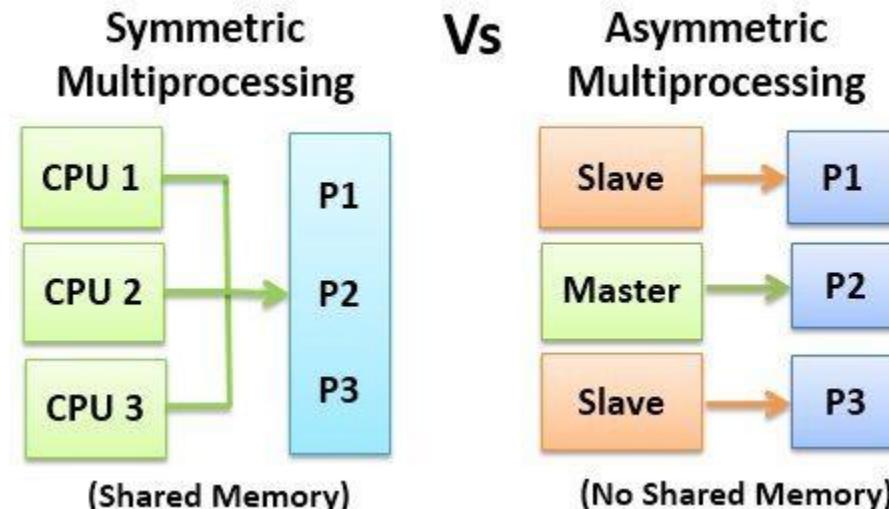

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.2. Operating System Classification

Parallel system

- Asymmetric multi processing (ASMP: asymmetric)
 - One processor controls the whole system
 - Other processors follow the main processor's commands or predetermined instructions
 - This model has the master-slave relation form: The main process will make schedule for other processors
 - Example: IBM Systerm/360

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.2. Operating System Classification

Distributed system

- Each processor has a local memory and communicate via transmission lines
- Processors are different from sizes to functions (personal machine, workstation, mini computer,..)
- Distributed system is used for
 - Resource sharing : provide a mechanism for file sharing, remote printer...
 - Increase computing speed: One computing operation is divided into smaller parts and performed on different places at the same time.
 - Safety: One position get problem, others can continue working

Chapter 1. Operating System Overview

3. Operating System definition and classification

3.2. Operating System Classification

Real-time processing system

- Used mainly in controlling field.
- Solve a problem no late than a specific time.
 - Each problem has a deadline
 - The system must generate correct result in a determined time period
- This OS requires highly cooperate between software and hardware.

Chapter 1 Operating System Overview

- ① Operating system notion
- ② History of Operating Systems
- ③ Definition and Classifications
- ④ **Basic Properties of Operating Systems**
- ⑤ Notions in operating systems
- ⑥ Operating System structures
- ⑦ Principles of Operating Systems

Basic Properties of Operating Systems

- High reliability
- Secure
- Effectiveness
- General overtime/ Inherit and adaption
- Convenience

Chapter 1 Operating System Overview

4. Basic Properties of Operating Systems

High reliability

- Every actions, notations have to be accurate
- Only provide information when it's surely correct
 - When error happens: notify and stop the proceed or let the user decide
 - Require support from device
- Example: C:/>COPY C:/F.TXT A:

Chapter 1 Operating System Overview

4. Basic Properties of Operating Systems

High reliability

- Example: C:/>COPY C:/F.TXT A:
 - Check the syntax of command copy
 - Check I/O card (motor, drive accessibility)
 - Check for file F.TXT existence in C drive
 - Check A drive
 - Check if file F.TXT already existed in A drive
 - Check if there is enough space in A
 - Check if the disk is write protection
 - Check written information (if required)
 -

Chapter 1 Operating System Overview

4. Basic Properties of Operating Systems

Basic Properties of Operating Systems

- High reliability
- Secure
- Effectiveness
- General overtime/ Inherit and adaption
- Convenience

Chapter 1 Operating System Overview

4. Basic Properties of Operating Systems

Security

- Data and programs have to be protected
 - No unwanted modification in every working mode
 - Secure from illegal access
- Different resources have different protection requirements
- Many levels protections with various of tools
- Important for multi tasking system

Basic Properties of Operating Systems

- High reliability
- Secure
- Effectiveness
- General overtime/ Inherit and adaption
- Convenience

Chapter 1 Operating System Overview

4. Basic Properties of Operating Systems

Effectiveness

- Resources are exploited thoroughly;
- Resource that is limited still able to handle complex requirement.
- The system need to maintain the synchronization;
- Slow devices do not affect the whole system operation

Basic Properties of Operating Systems

- High reliability
- Secure
- Effectiveness
- Generalizable overtime/ Inherit and adaption
- Convenience

Chapter 1 Operating System Overview

4. Basic Properties of Operating Systems

Generalizable overtime

- System must be Inheritable
 - Operations, notification can not change
 - If changed: notify and with detailed guide (chkdsk/scandisk)
 - Help keeping and increasing users
- System must have ability to adapt to changes that may happen
 - Example: Y2K problem; FAT 12/16/32

Basic Properties of Operating Systems

- High reliability
- Secure
- Effectiveness
- General overtime/ Inherit and adaption
- Convenience

Chapter 1 Operating System Overview

4. Basic Properties of Operating Systems

Convenience

- Easy to use
- Various effective levels
- Have many assisting system

Chapter 1 Operating System Overview

- ① Operating system notion
- ② History of Operating Systems
- ③ Definition and Classifications
- ④ Basic Properties of Operating Systems
- ⑤ **Notions in operating systems**
- ⑥ Operating System structures
- ⑦ Principles of Operating Systems

Notions in operating systems

- Process and Thread
- System's resources
- Shell
- System calls

Chapter 1 Operating System Overview

5. Notions in operating systems

5.1. Process and Thread

Process

- A running program
 - Codes: Program's executable instruction
 - Program's data
 - Stack, stack pointer, registers
 - Information that is necessary for running program
- Process >< program
 - Program: a passive object, contains computer's instructions to perform a specific task
 - Process: program's active state.

Chapter 1 Operating System Overview

5. Notions in operating systems

5.1. Process and Thread

Multi-process timesharing system:

- Periodically: OS pause one process and start another process
 - Need to store processes' information ⇒ process table
- One process can start other process
 - Ex: OS's Shell start a process to perform the command; when the command is done, terminate the started process
- Process can exchange information
- One process can include many threads

Chapter 1 Operating System Overview

5. Notions in operating systems

5.1. Process and Thread

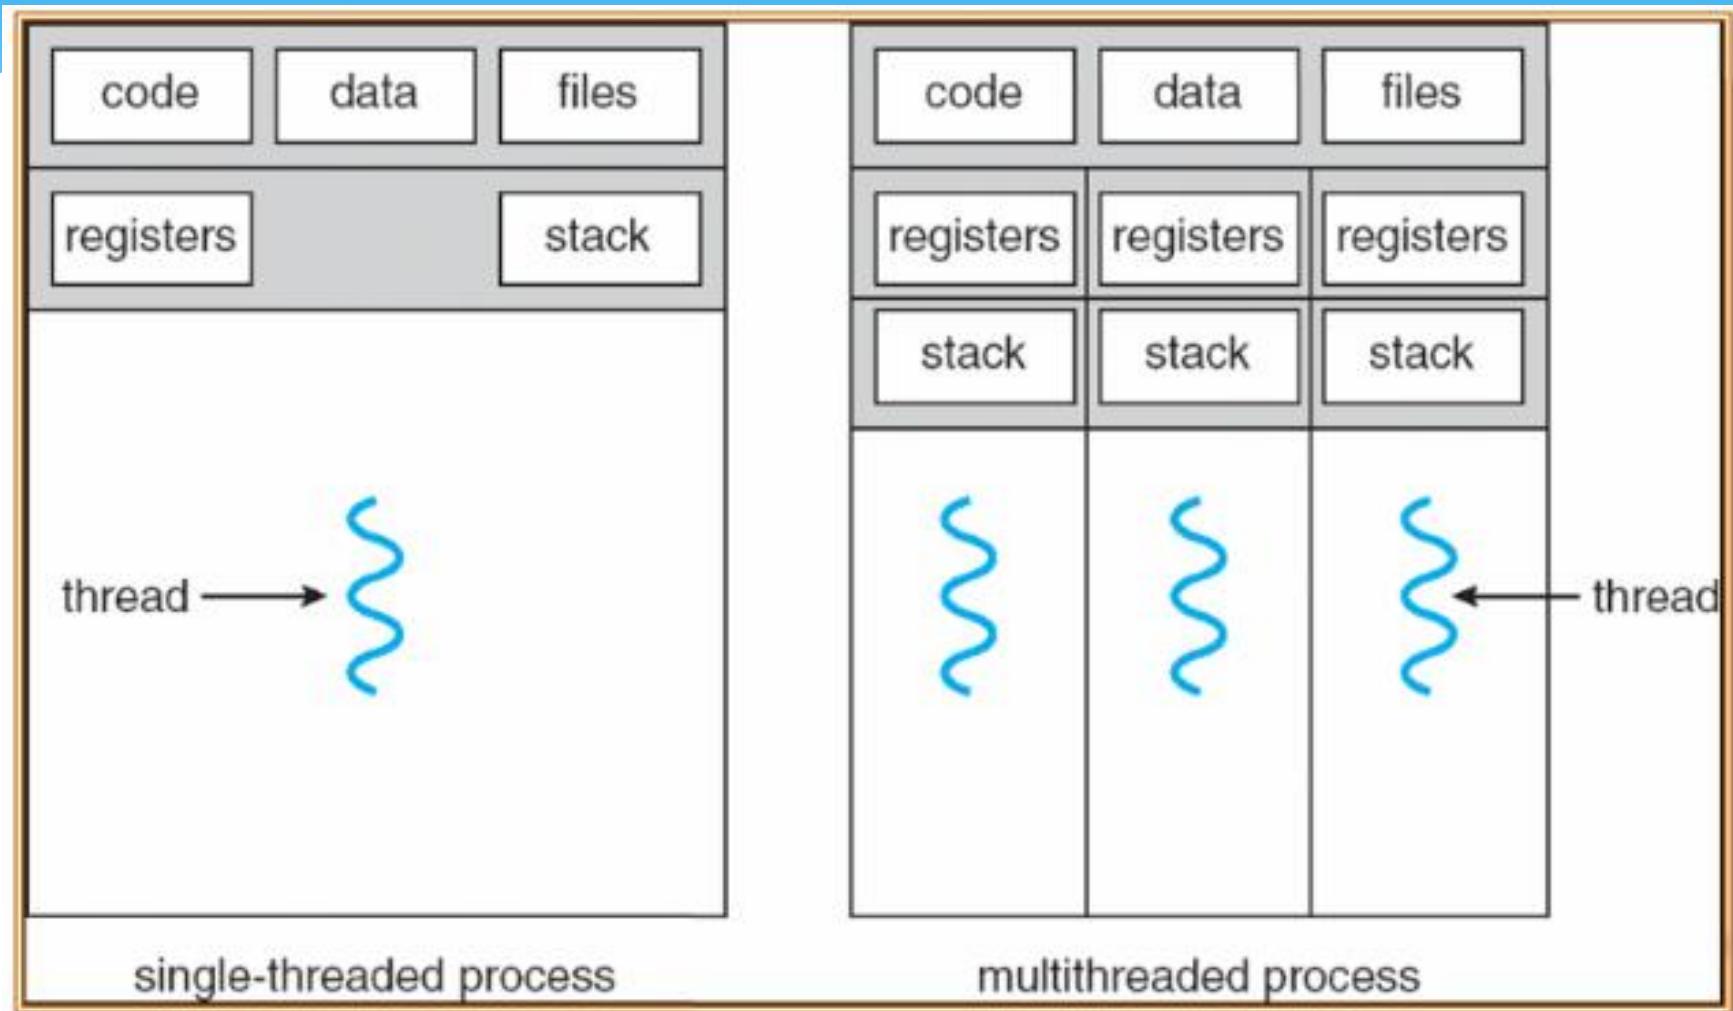

Thread

- A sequence/thread of instructions executed in the program
 - Executable code, data
 - Instruction pointer, stack, registers
- Heavyweight Process: process contains one thread
- Lightweight process: contains more than one thread
- Multi_Threading model:
 - Threads running parallel, sharing process's global variables

Chapter 1 Operating System Overview

5. Notions in operating systems

5.1. Process and Thread

Notions in operating systems

- Process and Thread
- System's resources
- Shell
- System calls

Chapter 1 Operating System Overview

5. Notions in operating systems

5.2 System's resources

Definition

- Everything that is necessary for a program to be performed
 - Space: System's storage space
 - Time: Instruction executing time, data accessing time
- System's resources
 - Memory
 - Distinguished by: Storage size, directly access, sequent access
 - Levelled by: main memory/internal; extend, external
 - Notions' distinguish: memory (physical area that contain data) and memory access (the process of searching for the data's location in memory)

Chapter 1 Operating System Overview

5. Notions in operating systems

5.2 System's resources

- System's resources
 - Memory
 - Processor
 - System's most important component
 - Access level: instruction
 - Processing time
 - Multi-processor system: each processor's time is managed and scheduled independently
 - Peripheral devices
 - Retrieve, output information (I/O device)
 - Attached to the system via controller
 - Commonly considered peripheral devices-controller devices

Chapter 1 Operating System Overview

5. Notions in operating systems

5.2 System's resources

Resource's classification

- Resource's types
 - Physical resource: physical devices
 - Logic resource: variable; virtual devices
- Sharing ability
 - Sharable resource: at a specific time, it can be allocate for different processes. Example: Memory
 - Non-sharable but dividable resource: Processes use the resource follow an order; Example: processor
 - Non-sharable and non-dividable resource: at a specific time, only one process can use the resource. Example: Printer

Chapter 1 Operating System Overview

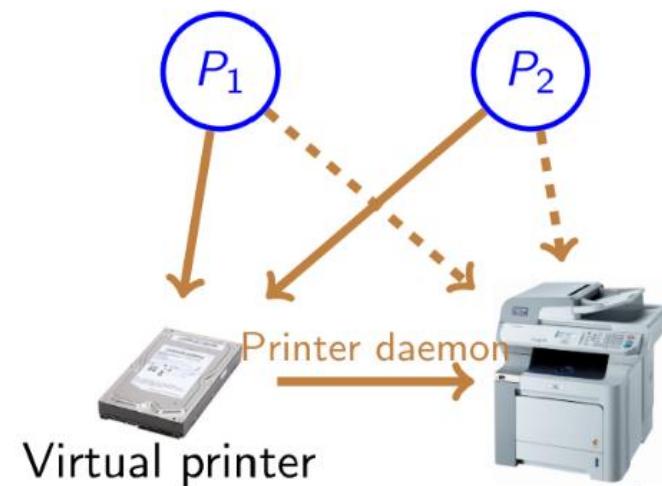

5. Notions in operating systems

5.2 System's resources

Virtual printer

- Resource allocated for user's program in a changed form
- Only appear when the system requires or when the system creates it
- Automatically disappear when the system terminates or more precisely, when the process that works with this resource terminates

Example: Virtual printer

Chapter 1 Operating System Overview

5. Notions in operating systems

Notions in operating systems

- Process and Thread
- System's resources
- Shell
- System calls

Chapter 1 Operating System Overview

5. Notions in operating systems

5.3 Shell

- A special process: user and OS communication environment
- Task
 - Receive user's command
 - Analysis received command
 - Generate new process to perform command's requirement
- Receives command from command's line or graphical interface
- Single task environment (MS-DOS):
 - Shell will wait until one process finishes and then receive new command
- In multi-tasking system (UNIX, WINXP, . . .) After creating and running new process, Shell can receive new command

Chapter 1 Operating System Overview

5. Notions in operating systems

5.3 Shell

Notions in operating systems

- Process and Thread
- System's resources
- Shell
- System calls

Chapter 1 Operating System Overview

5. Notions in operating systems

5.4 System calls

- Provides environment for interacting between user's program and the operating system
 - Programs utilize system calls to request services from operating system
 - Create, delete, use other software objects operated by the operating system
 - Every single system call is corresponding to a library of sub-programs (functions)
- System calls are done in the form of
 - Instructions in low-levels programming languages
 - Interrupt requests (Int) in assembly language
 - API functions calls in Windows
- Input parameters for the services and returned results are located in special memory areas
 - For example: when making request for an interrupt, the function name is stored in the register AH
 - Int 05 : print to monitor ; Int 13/AH=03h : DISK – WRITE/ DISK SECTOR

Chapter 1 Operating System Overview

5. Notions in operating systems

5.4 System calls

Example

Func BOOL WINAPI ExitWindowsEx(int uFlags, int dwReason);

uFlags	Shutdown types
EWX_LOGOFF	End process and exit Windows
EWX_POWEROFF	Shutdown system and turn off computer
EWX_REBOOT	Shutdown and restart computer

dwReason	Reason for shutdown
----------	---------------------

File log_off.c

```
#include <windows.h>
int main(int argc, char* argv[]){
    ExitWindowsEx(EWX_LOGOFF, 0);
    return 0;
}
```

Chapter 1 Operating System Overview

- ① Operating system notion
- ② History of Operating Systems
- ③ Definition and Classifications
- ④ Basic Properties of Operating Systems
- ⑤ Notions in operating systems
- ⑥ **Operating System structures**
- ⑦ Principles of Operating Systems

Chapter 1 Operating System Overview

6. Operating System structures

- System's components
- Operating system's services
- System calls
- Operating system's structures

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

- Process management
- Main memory management
- Input Output system management
- Files management
- Storage memory management
- Data transmission system (network)
- Protection system
- User interface

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

Process management

- Process: A running program
- Process utilize system's resources to complete its task
 - Resources are allocated when process created or while it's running
 - Process terminates, resources are returned
- It is possible for many processes to exist in the system at the same time
 - System process
 - User process
- The tasks of OS in process management
 - Create and terminate user's process and system's process
 - Block or re-execute a process
 - Provide mechanism for process synchronization
 - Provide method for processes' communication
 - Provide mechanism for controlling deadlock among processes

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

Main memory management

- Main memory: an array of byte(word); Each element has an address; where data are accessed by CPU
- To be executed, a program must be given an absolute address and loaded into main memory. When the program is running, the system access instructions and data in main memory.
- To optimize CPU time and computer's speed, some processes are kept in memory
- The role of OS in main memory management
 - Store information about used areas in memory and who used them
 - Decide which process will be fetched into main memory when the memory is available.
 - Allocate and retrieve memory when it's necessary

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

Input-Output system management

- Objective: hide physical devices' details from users to help them operate easier.
- Input-Output system management includes
 - Memory management of buffering, caching, spooling
 - Communicate with device drivers.
 - Controller for special hardware devices. Only device driver understand its associated-device's specific structure

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

File management

- Computer can store information on many types of storage devices
- File: storage unit
- File management task
 - Creates/ deletes a file/directory
 - Provides operations over files and directory
 - Reflects file on secondary storage system
 - Backs up file system on storage devices

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

Storage memory management

- Program is stored in secondary memory (magnetic disk) until it's fetched into main memory and executed.
- Disk is utilized for storing data and processed result.
- Data and result can be stored temporarily on disk: virtual memory
- The role of operating system in disk management
 - Unused area management
 - Provide storage area as requested
 - Schedule disk accessing effectively

Some mechanism
will later
be learnt and
included in
final exam

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

Data transmission system (Distributed system)

- Distributed system combined of set of processor (sym/asym) without common clock and memory. Each processor has a local memory.
- Processor connected via transmission network
- Transmission is performed via protocols (FTP, HTTP...)
- Distributed system allow user to access different resource
- Access to sharing resources will allow
 - Increase computing speed
 - Increase data availability
 - Increase the system reliable

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

System's protection

- Multi users operate with the system at the same time ⇒ Processes have to be protected from other processes' activities
- Protection is a controlling mechanism of program or user's access to system or resource
- Protection mechanism will require
 - Distinguish between legal or illegal usage
 - Set imposed controls
 - Provide tools for imposing

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

User interface

- Perform user's command. Commands are provided for operating system 's command controller to
 - Create and manage process
 - Manage main memory and storage memory
 - Access file system
 - Protect
 - Network system
 - . . .
- User interface can be command line (DOS, UNIX) or more friendly with graphical interface (Windows, MacOS)

Chapter 1 Operating System Overview

6. Operating System structures

6.1 System's components

User interface

Some forms of human-computer interact

- Command line

- Simple but organized
- Do not require complex system specification
- Easy to add parameter

- Selection table

- Menu
- Popup
- Menu_popup: 2 method: on and onselect

- Symbol

window, icon, desktop

Chapter 1 Operating System Overview

6. Operating System structures

- System's components
- Operating system's services
- System calls
- Operating system's structures

Chapter 1 Operating System Overview

6. Operating System structures

6.2 Operating system's services

Main and basic services

- **Program execution:** the system is able to load the program into memory and execute it. Program must be finish execution in a normal or abnormal (has error) way.
- **Input-output operations:** To increase the performance, programs do not directly access IO devices. The OS has to provide means to perform I/O.
- **File system operations:** Program is able to read, write, create or delete file.
- **Communication:** Information exchange between running process on the same computer or different computer in the network.
- **Communication is performed via sharing memory or message transferring technique.**
- **Error detection:** Confirm work correctly by showing an error is from CPU, memory, in devices or in programs. Each type of error, OS has a corresponding way to handle.

Chapter 1 Operating System Overview

6. Operating System structures

6.2 Operating system's services

Support services

Not for user but for operate the system effectively

- **Provide resources** Allocate resource for many users or tasks to perform at the same time
- **Report statistics** Store information of types and amount of used resources for computing (usage cost), research (system improvement)
- **Protection** Ensure all access to system resources are controlled

Chapter 1 Operating System Overview

6. Operating System structures

- System's components
- Operating system's services
- **System calls**
- Operating system's structures

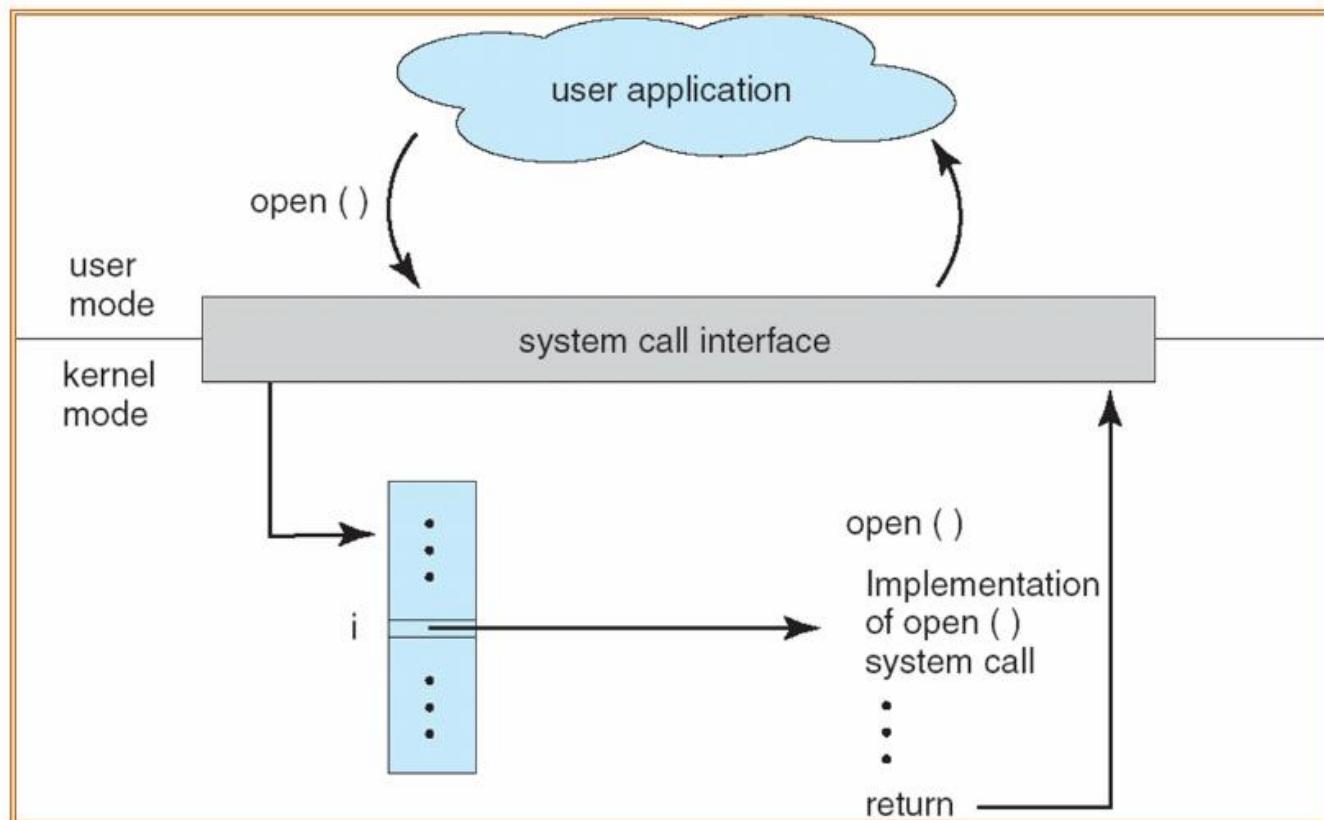

Chapter 1 Operating System Overview

6. Operating System structures

6.3 System call

System call

Provide an interface between process and operating system

Chapter 1 Operating System Overview

6. Operating System structures

6.3 System call

System call

- Process management: initialize, terminate process...
- Memory management: allocate and free memory...
- File management: create, delete, read and write file...
- Input Output device management: perform input/output...
- Exchange information with the system. Example get/set time/date...
- Inter process communication

Chapter 1 Operating System Overview

6. Operating System structures

- System's components
- Operating system's services
- System calls
- Operating system's structures

Chapter 1 Operating System Overview

6. Operating System structures

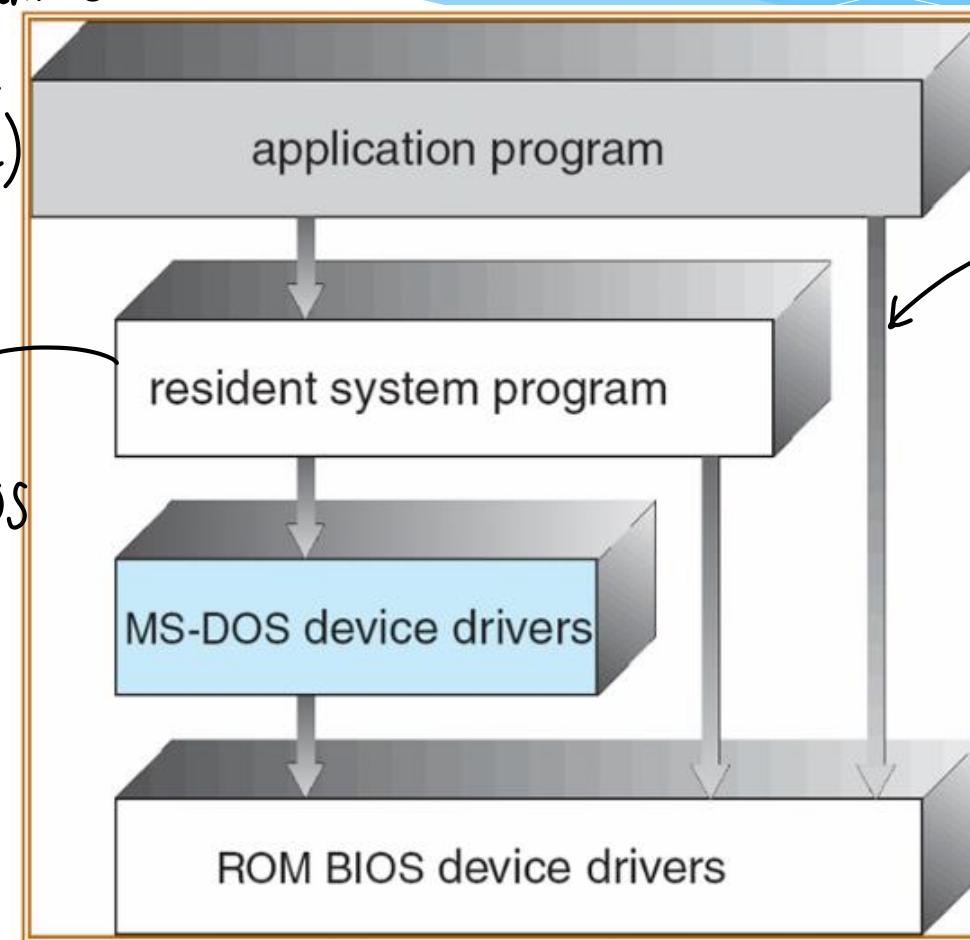

6.4 Operating system's structures

MS-DOS structure (Silberschatz 2002)

\ single-program OS

(can run at most 1
program at a time)

programs
that stay
permanent
inside the OS

even the
user can
access the
lowest lvl
of sys
↓

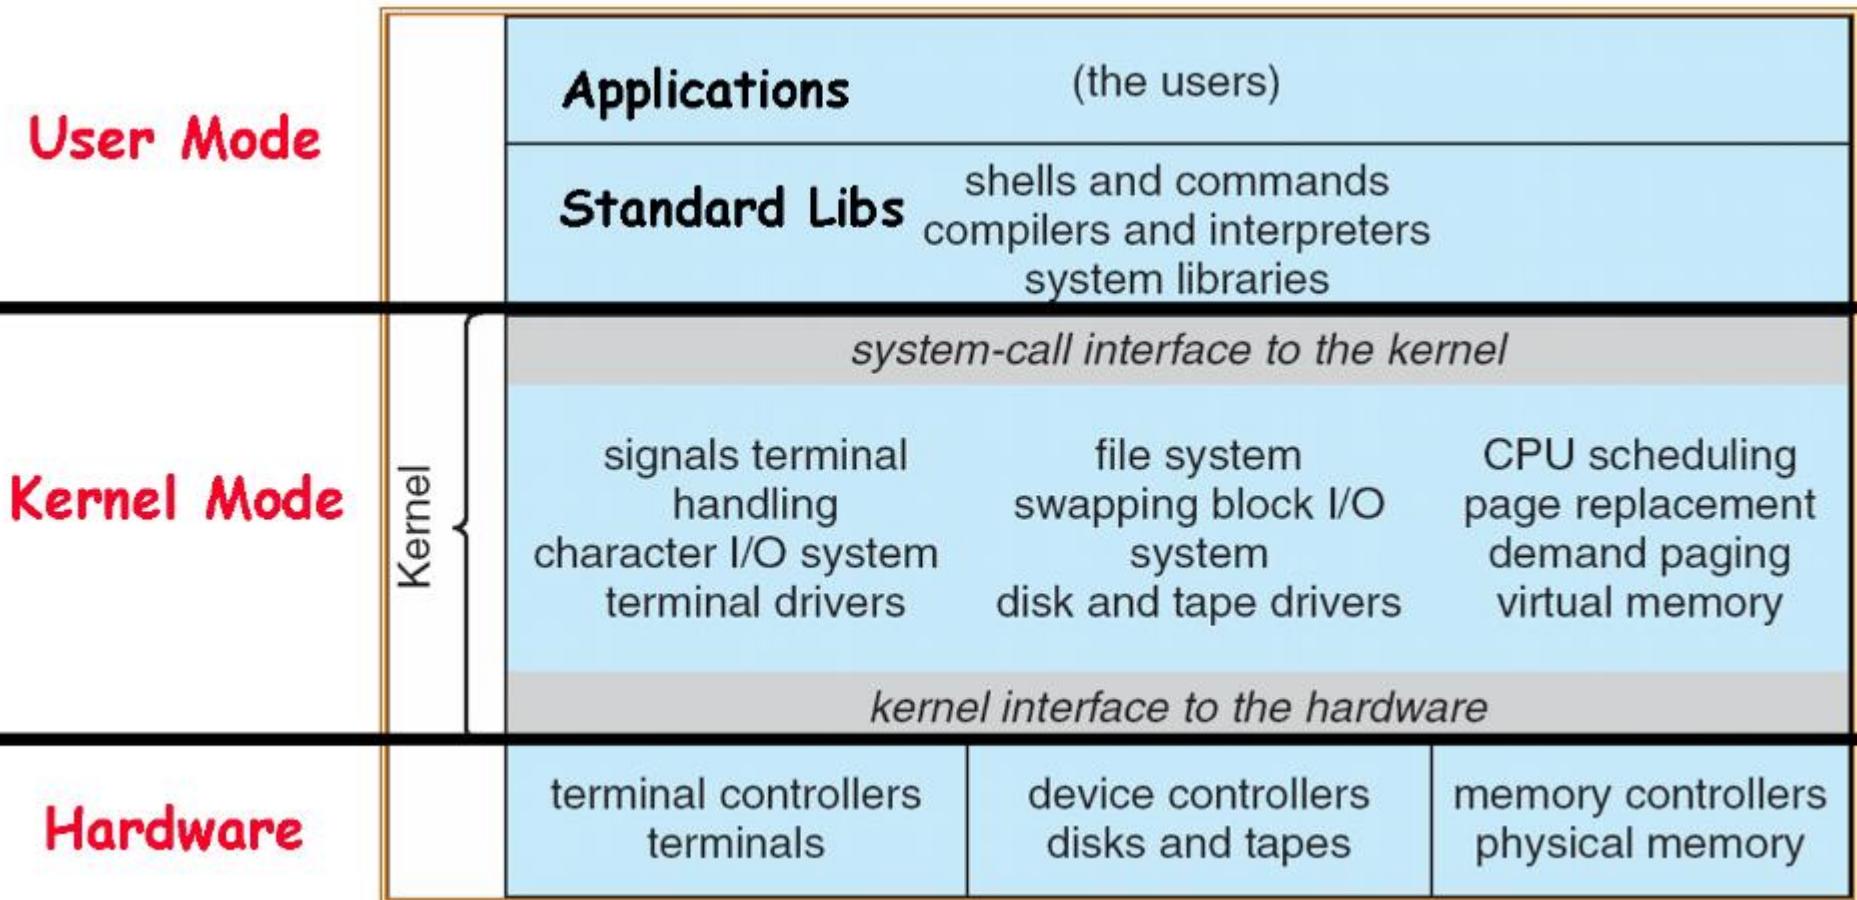

No protection

Chapter 1 Operating System Overview

6. Operating System structures

6.4 Operating system's structures

UNIX structure (*Silberschatz 2002*)

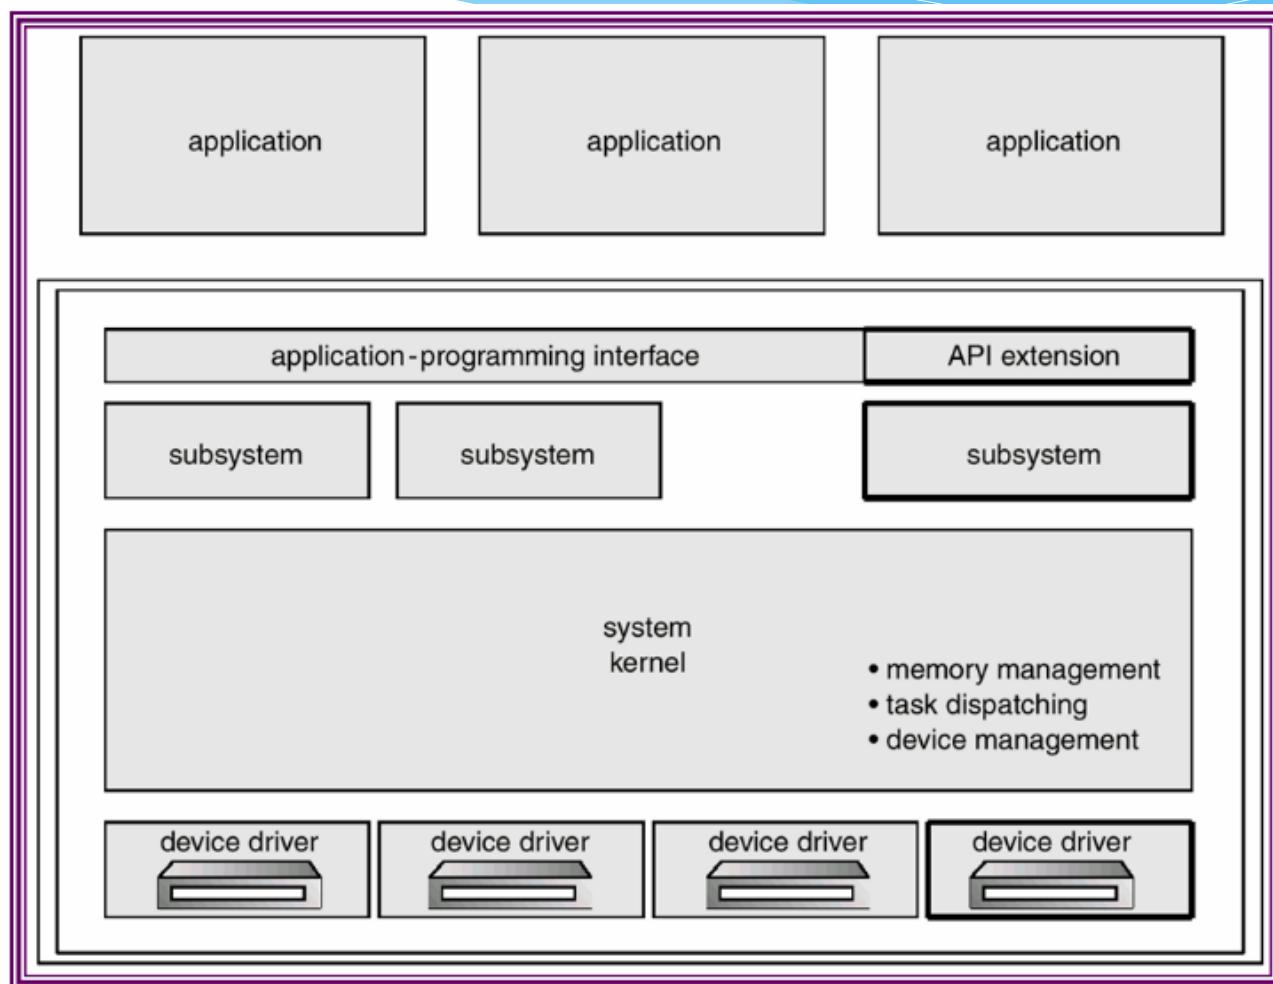

Chapter 1 Operating System Overview

6. Operating System structures

6.4 Operating system's structures

OS/2 structure (*Silberschatz 2002*)

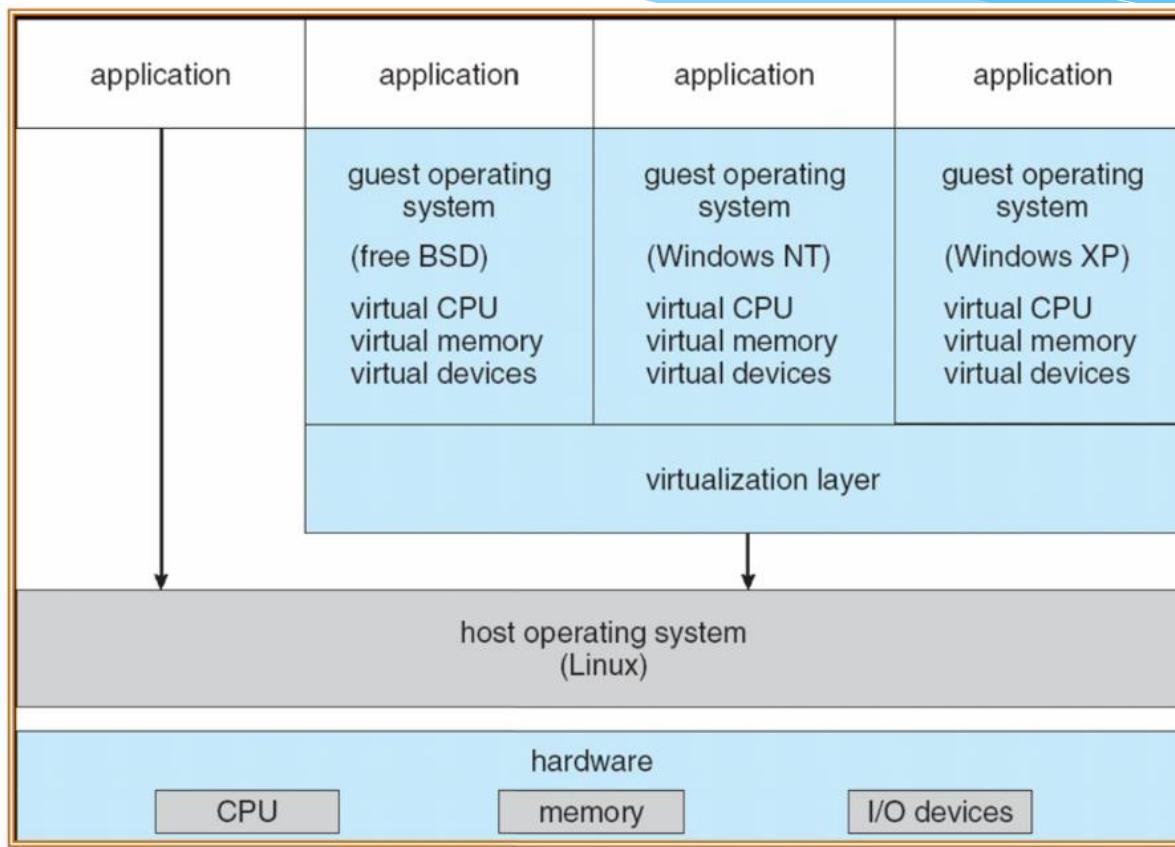

Chapter 1 Operating System Overview

6. Operating System structures

6.4 Operating system's structures

Virtual machine(**Silberschatz 2002**)

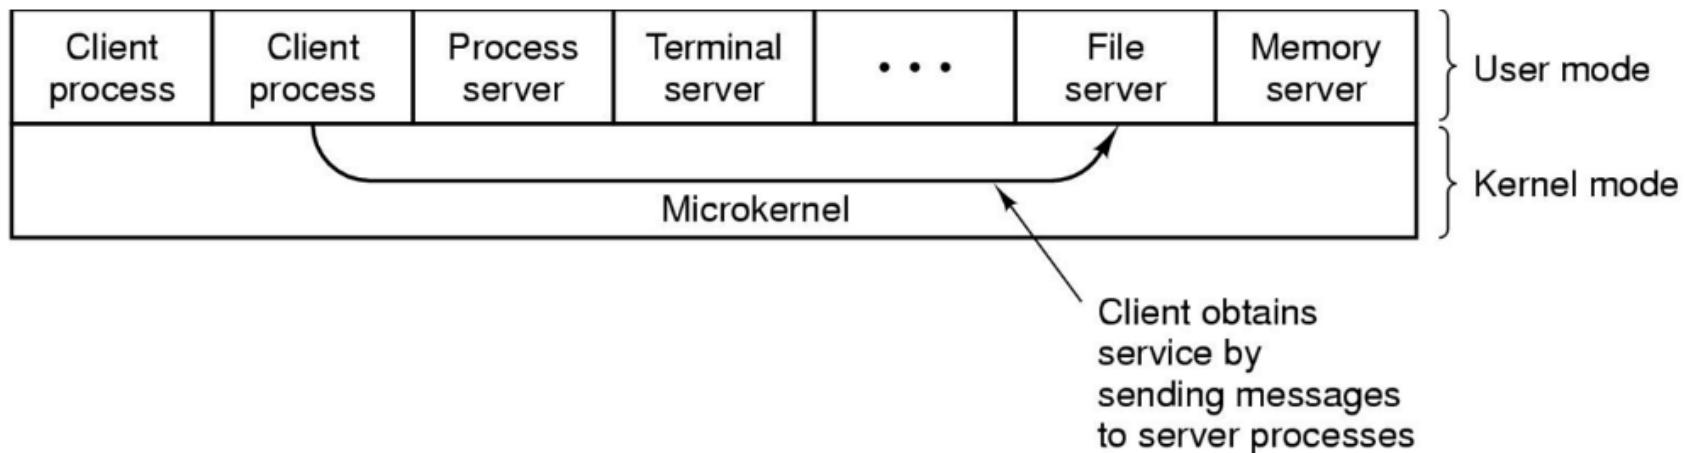

VMWare architecture

Chapter 1 Operating System Overview

6. Operating System structures

6.4 Operating system's structures

Client-Server Model ([Tanenbaum 2001](#))

Chapter 1 Operating System Overview

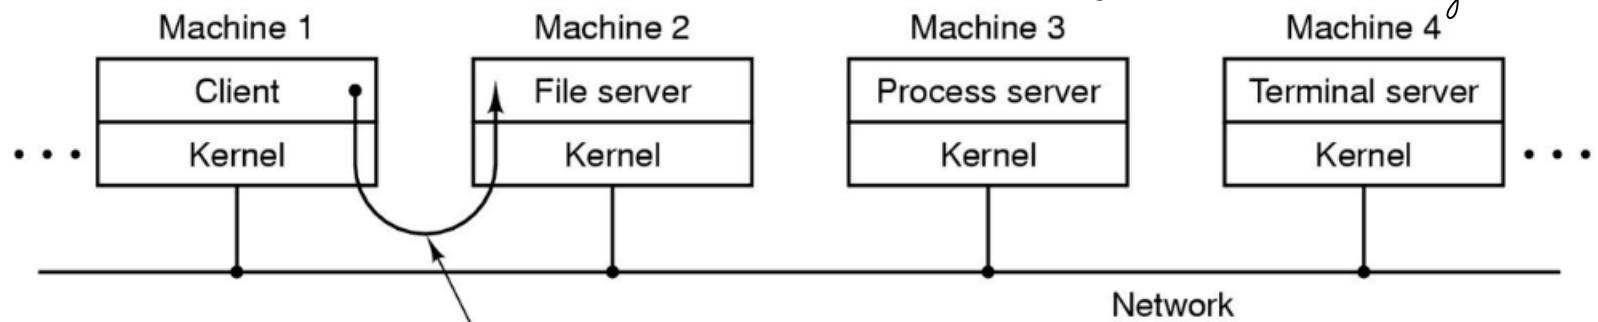

6. Operating System structures

6.4 Operating system's structures

Client-Server model in distributed OS (Tanenbaum 2001)

using micro-kernel

↳ OS components are made portable ; not part of the kernel
⇒ OS can be distributed, kernel for communication only

→ Modern OS uses a hybrid approach

Monolithic VS. Micro-kernel

Chapter 1 Operating System Overview

- ① Operating system notion
- ② History of Operating Systems
- ③ Definition and Classifications
- ④ Basic Properties of Operating Systems
- ⑤ Notions in operating systems
- ⑥ Operating System structures
- ⑦ Principles of Operating Systems

5 Basic Properties of OS

- ① High-reliability : any notification, info is accurate
 - ↳ hardware support
 - ↳ by checking
- ② Security : user + program should be protected ; $\not\exists$ unwanted access / modification
- ③ Effectiveness : sys should exploit the resources
 - ↳ handle complex requirements on limited resources
 - ↳ protect sys from 1/some slow devices
- ④ Generalization over time (Inherit / Adaptability)
 - ↳ Adapt to changes/incident that may happen
 - ↳ Inherit to serve more users
- ⑤ Convenience

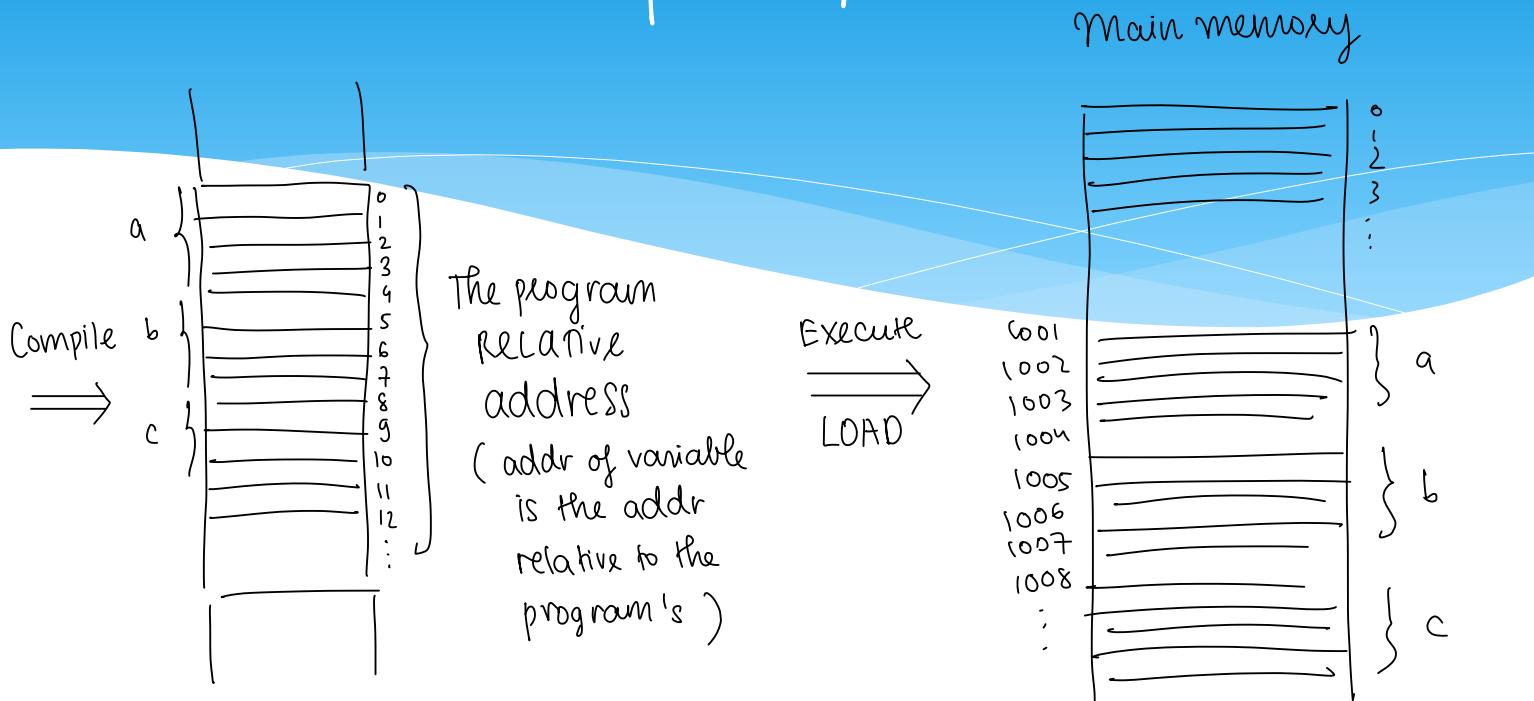

Can
also applied
for
Softwares

Principles of Operating Systems

- Modular principle
- Relatively localization principle
- Macroprocessor principle
- Initialization when start-up principle (khởi tạo)
cấu trúc
- Function overlap principle
- Standard value principle
- Multi-level protections principle

Relative localization principle

```
int a;  
int b;  
float c;  
void main() {  
    c = a + b;  
}
```

Everytime we execute a program, it will be loaded onto another area in main memory!

↳ that's why we can NOT use absolute address in our code

↳ We use the relative address

(Các câu lệnh ở đt sử dụng chỉ huyết đt)

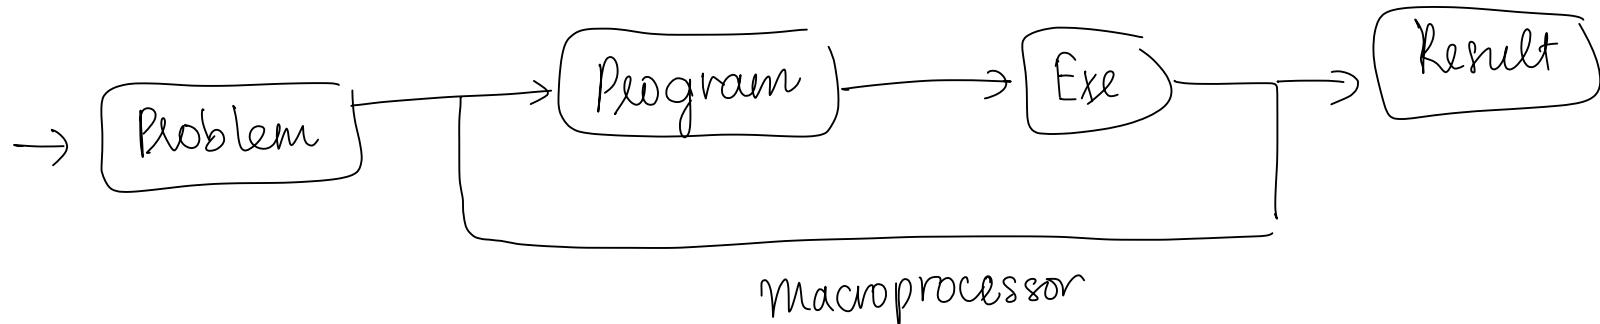

Macroprocessor Principle

(các lệnh trên máy chủ
gọi là các 'macro')

- ① Receive requests
- ② list out modules that can satisfy user's requests
- ③ Merge these modules onto 1
- ④ Run this new process \Rightarrow Return

* OS works like a macro processor, not a single processor (do the task itself)

(does not prep the prog to serve users beforehand)

Initialization when Start-up / Generate principle

OS is made up of modules in the available module repo to satisfy

- machine's config
- user's request

Set-up

Select module / Set parameters / choose dest folder

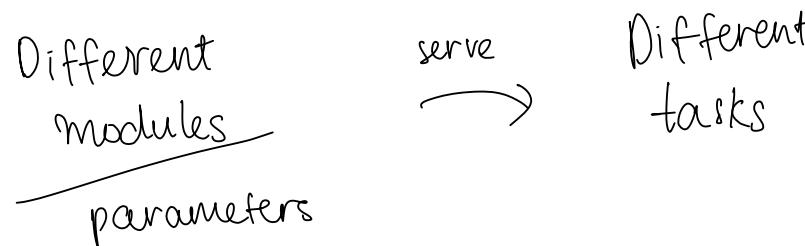

Install

Principle of Functional Repetition

Standard Value Principle

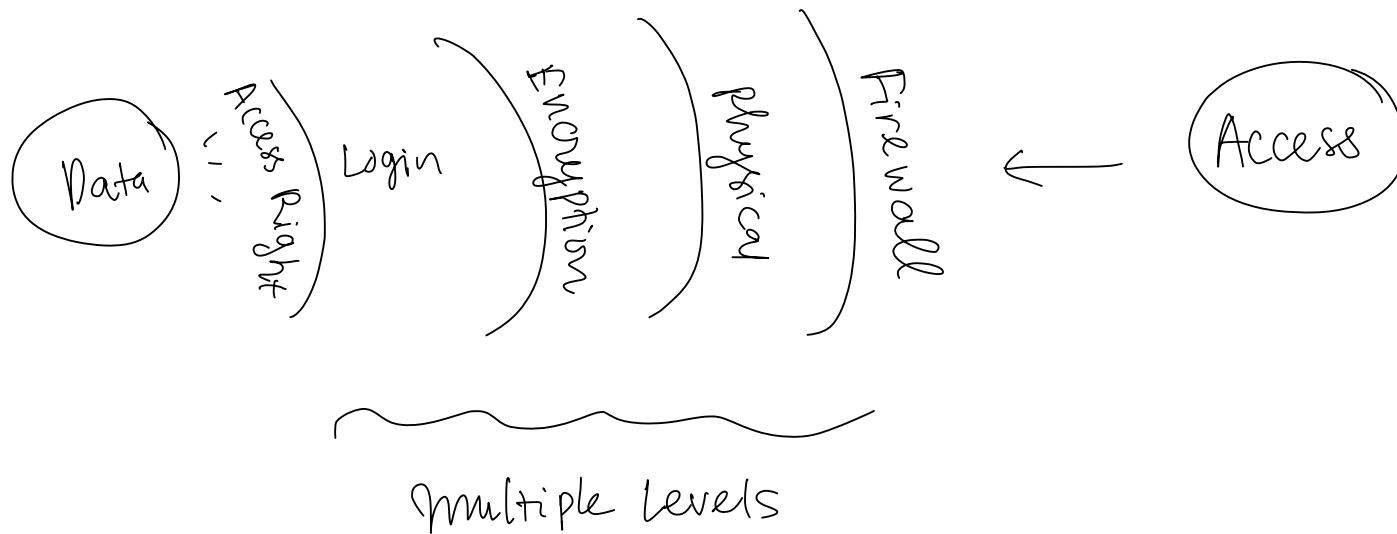

- Module parameterization → ↑ module flexibility
- ① Need to remember parameters (nb, meaning of each...) so that we do NOT give the wrong inputs
 - ↳ solution: default|values (kept in some special tables)
 - ↳ for convenience + safety

Windows registry

Multi-level protection

Different resources → Diff. characteristics → Diff. methods of protection

Chapter 1 Operating System Overview

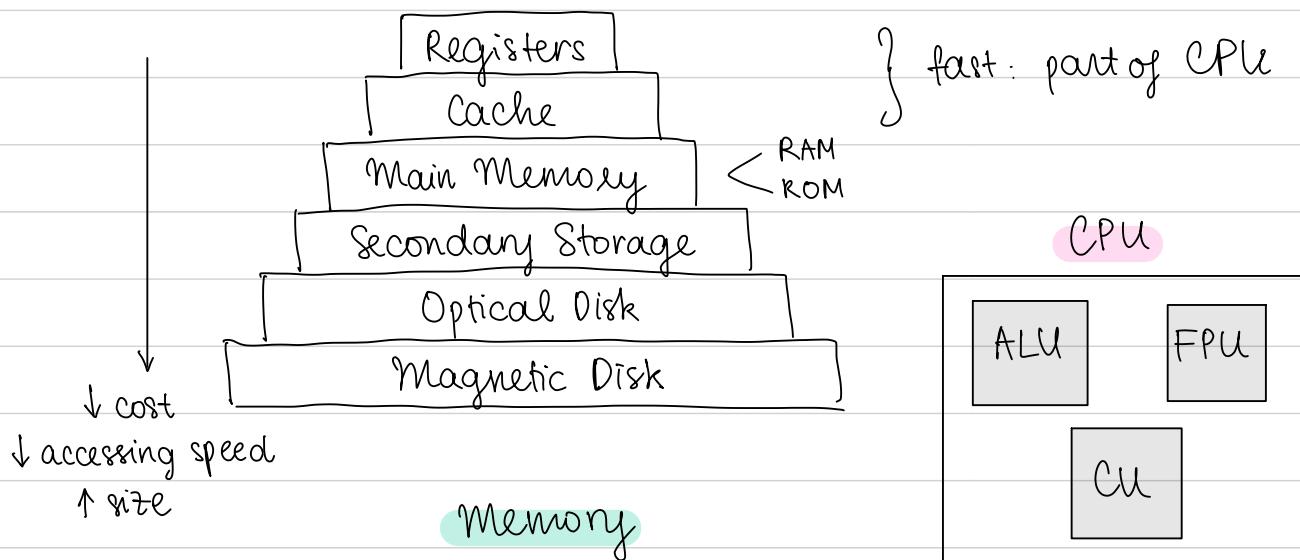

Summary

- ① Notion of Operating system
 - Layering structure of OS
 - OS's functions
- ② History of Operating system
 - History of computers
 - History of Operating system
- ③ Definition and classification of OS
 - Definitions
 - Classification
- ④ Basic properties of OS
 - High reliability
 - Security
 - Effective
 - Generalize overtime
 - Convenience

- ⑤ Notions of Operating system
 - Process and Thread
 - System's resources
 - Shell
 - System calls
- ⑥ Operating system's structure
 - OS's components
 - OS's services
 - System calls
 - System's structures
- ⑦ Principles of Operating System

① OS Concepts

* Hardware

ALU : arithmetic-logic unit

FPU : floating-point unit

CU : control unit

Registers

① General purposes

↳ can be used for lots of tasks

AX : accumulator

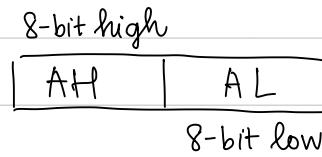

BX : base

CX : count

DX : data

(16-bit)

short

↓
similarly...

BH/BL CH/CL DH/DL

int

long

Extended (32-bit)

(EAX

EBX

ECX

EDX

RAX

RBX

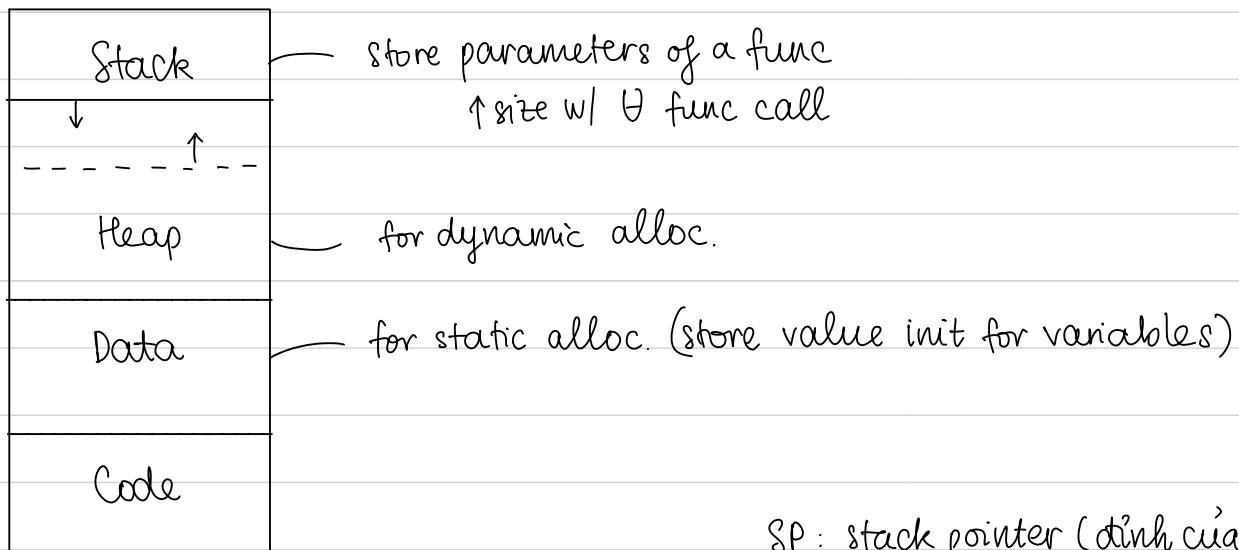

RCX

RDX

(64-bit)

② Program-specific ①

4 parts of a program.

SP: stack pointer (định vị stack)

BP (phụ trợ)

store the address of the code seg.

GS

ES

DS

SS

Registers ↳ CS (code seg)

IP (instruction pointer)

PC

Intel term®

(program counter)
(other manufacturer)

where/which instruction

we've performed - to perform next

③ Flags (1 register for flag : 8 flags)

(overflow flag) (zero flag) → use for comparison/

OF ↴ ZF

subtraction

→ when result = 0

~~ status ~~

CF (carry flag)

→ for non-sign nb

TF (trap)

→ establish by compiler

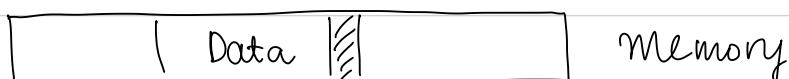

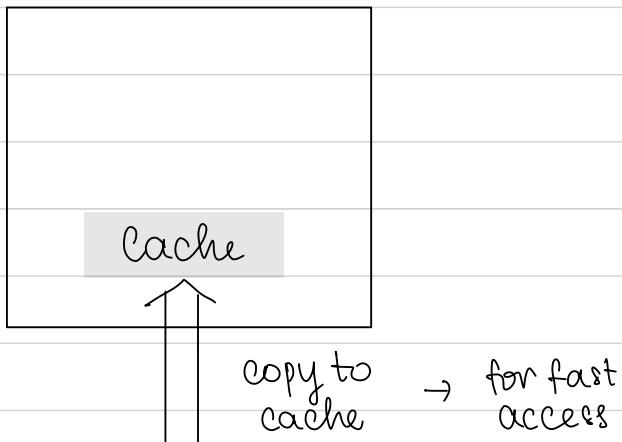

→ for debugging

DF (direction)

→ direct the way of index traverse

Cache

CPU

(recently used
data)

there is a high chance
we'll reuse them

Bus (→ for transport...)

(1) Address → address of data block CPU need

(2) Data → the data

(3) Control → control signal from proc.

↓
other parts

* Software

a) Commercial b) Source-code Openness

① Licensed

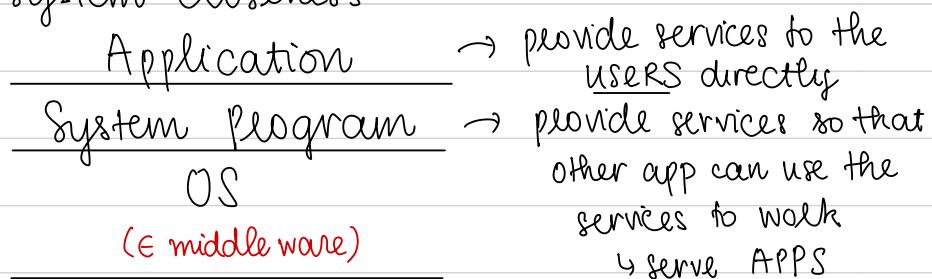

① Open-sre

② Free

② Closed

③ Trial

c) System-closeness

BIOS

(basic I/O system)

- made by hardware manufacturer
- basic programs that work w/ hardware
- store on ROM
